# Chapter 1

## Basic Administration Tasks

---

This chapter describes the various tasks that you can perform to effectively manage an ArcSight Express v3.0 installation, performing additional configuration and maintenance operations for ArcSight Manager and the database.

The following topics are covered here:

- ["Supported Scripts on the Appliance" on page 7](#)
- ["Starting the ArcSight Console" on page 8](#)
- ["Starting ArcSight SmartConnectors" on page 9](#)
- ["Reconnecting to the ArcSight Manager" on page 9](#)
- ["Reducing Impact of Anti-Virus Scanning" on page 10](#)
- ["License Tracking and Auditing" on page 10](#)

## The Home Directory for All Components on ArcSight Express v3.0

The home directory, referred to as <ARCSIGHT\_HOME> for all the components residing on the ArcSight Express v3.0 appliance is as follows:

Manager: `/opt/arcsight/manager`

CORR-Engine: `/opt/arcsight/logger/current/arcsight/logger`

Web: `/opt/arcsight/web`

## Supported Scripts on the Appliance

Running unsupported scripts on the ArcSight Express v3.0 appliance may produce unexpected results, including system failure or data loss.

Use the following "arcsight\_services" service script to manage processes:

To start all services on the appliance, run:

```
/sbin/service arcsight_services start all
```

To stop all services on the appliance, run:

```
/sbin/service arcsight_services stop all
```

To see the status of the services, run:

```
/sbin/service arcsight_services status all
```

To start the Manager, run:

```
/sbin/service arcsight_services start manager
```

To stop the Manager, run:

```
/sbin/service arcsight_services stop manager
```

If you inadvertently run unsupported scripts, rebooting the system will restore proper operation in most cases.

## ArcSight Manager Decoupled Process Execution

ArcSight Manager uses decoupled process execution to perform specific tasks, for example to compile rulesets, either on initial startup or when the real-time rules group changes. To do so, ArcSight Manager uses a standalone process executor (instead of using “in process” or “direct process” execution). ArcSight Manager sends commands to be executed via the file system. The process executor uses the `<ARCSIGHT_HOME>/tmp` directory, so you should restrict system level access for this directory.

The ArcSight Manager scripts ensure that the Process Executor will be executed as a daemon before the ArcSight Manager is started. This has some implications with regards to troubleshooting ArcSight Manager startup and runtime problems. The ArcSight Manager, if configured to use the Process Executor, will not start if the presence of a running Process Executor cannot be detected. The Process Executor runs within its own watchdog, in the same fashion as the ArcSight Manager, so if the process stops for any reason, it will restart automatically. The process executor is transparent to users regarding the way that ArcSight Manager is started or stopped.

The `stdout` and `stderr` of the executed process will be written into the following two files:

```
<ARCSIGHT_HOME>/tmp/[commandfile-name].stdout
```

```
<ARCSIGHT_HOME>/tmp/[commandfile-name].stderr
```

## Starting the ArcSight Console

To start up the ArcSight Console:

- 1 Open a command window or shell window on `<ARCSIGHT_HOME>/bin`.
- 2 Type in the following line and press **Enter**.

```
./arcsight console
```

## Setting up a Custom Login Message

You can configure the ArcSight Manager to display a custom message before allowing users to log in to the Console or ArcSight Web. Set the following property in `server.properties`:

```
auth.login.banner=config/loginbanner.txt
```

This property configures the Manager to display the text from the file `<ARCSIGHT_HOME>/config/loginbanner.txt` whenever a user runs the Console. (Changes to the properties file take effect the next time the Manager is started.)

Create a text file named `loginbanner.txt` in the `<ARCSIGHT_HOME>/config` directory. This feature is often used to display a legal disclaimer message. Users must close the message window before they can log in.

The ArcSight Web console will display the custom banner as well, provided that the browser used supports JavaScript and has JavaScript enabled. To configure a custom banner for Web Console:

- 1 Create a custom logo image in .gif or .png format (such as `MyLogo.gif`). The image should be approximately 138 x 39 pixels.
- 2 On the Web server machine, copy this custom logo image file to the `<ARCSIGHT_HOME>/webapp/images` directory.
- 3 Copy the following properties from the `example.styles.properties` file located at `<ARCSIGHT_HOME>/config/web` directory to `styles.properties` file in the same directory. Create a `styles.properties` file if one does not already exist.

```
# logo image for login page

loginLogoImg = <demo-logo-login.png>
```

- 4 Replace 'demo-logo-login.png' with your custom logo image file name. For example, `loginLogoImg=MyLogo.gif`
- 5 Close the Web Console.
- 6 Restart Web server and log into the Web console.

You should see this newly added custom Web logo image in Web console Login Window.

When you uninstall the Web, `style.properties` and your custom logo image files are deleted. Make sure to save these files so that you can use them when you reinstall the Web

## Starting ArcSight SmartConnectors

It's a good idea for the ArcSight Console to be running, so that you can see the status of the configured SmartConnectors and view messages as they appear on the Console. To start up an ArcSight SmartConnector:

- 1 Open a terminal box.
- 2 Type in the following line and press **Enter**:

```
./arcsight agents
```

## Reconnecting to the ArcSight Manager

If the ArcSight Console loses its connection to the ArcSight Manager—because the Manager was restarted, for example—a dialog box appears in the ArcSight Console stating that your

connection to the ArcSight Manager has been lost. Click **Retry** to re-establish a connection to the ArcSight Manager or click **Relogin**.

The connection to the ArcSight Manager cannot be re-established while the ArcSight Manager is restarting. In some cases, a connection cannot be established without resetting one or both machines.

Clicking **Retry** may display connection exceptions while the ArcSight Manager is restarting, or as the connection is re-established.

---

## Reducing Impact of Anti-Virus Scanning

Files in certain directories are updated frequently; for example, the log directory. When an anti-virus application monitors these directories, it can impact the system in these ways:

- Place a large and constant load on the CPU of the machine.
- Slow down the software as frequent scanning can impede writes to disk.

Therefore, we recommend that you exclude the following directories (and any subdirectories under them) in `<ARCSIGHT_HOME>` from the virus scan list:

- `caches/server`
- `logs`
- `system`
- `tmp`
- `user`, but include the `user/agent/lib` directory in the scan
- `archive`

## License Tracking and Auditing

The ArcSight Express v3.0 appliance automatically maintains a license audit history that allows you to see how many licenses are currently in use. When users log into the Console they will receive a warning notifying them if they have exceeded their current license. An internal audit event will be created for each licensable component to help users track which areas have been exceeded. There are licensing reports on individual features. These reports are located in `/All Reports/ArcSight Administration/ESM/Licensing/`. The reports provide a summary for the number of Actors, Assets, Users, Devices, and EPS identified over the last week.

## Licensed EPS Compliance

By default, your events per second (EPS) throughput is monitored once every 24 hours and an average EPS value is calculated for that period. Your license places a limit on this average EPS throughput. It also places a limit on the number of times you are allowed to exceed the EPS limit over a period (rolling window) of days. In a given window, each time your EPS throughput exceeds the limit allowed by your license, it gets recorded. As soon as you cross the number of times permitted by your license to exceed the EPS limit, your installation becomes noncompliant causing you to be temporarily locked out from using certain functionality (for example, some Console features might get disabled).

An Example:

Say your license is set up for the following:

- Number of incoming EPS allowed = 1000 EPS
- Number of times allowed to exceed 1000 EPS = 5 times
- Period over which you are allowed to exceed the 1000 EPS limit 5 times = 7 days

The above three bullets indicate that on any given day, as long as you have not exceeded an average of 1000 EPS more than 5 times in the past 7 days (counting today as day 1), you are in compliance with your license. But, if you exceed the 1000 EPS limit for the 6th time within the past 7 days, you become noncompliant and may lose some functionality as a consequence.

Once the functionality gets disabled, it stays disabled for a period of time. The length of this period starts with one hour and progressively increases by an hour for each consecutive day that the system is noncompliant. It can increase up to a maximum of 5 hours depending upon how long you have been noncompliant. So, suppose your license allows you to exceed the EPS limit 5 times in a 7-day period, when you exceed the limit a 6th time in the same period, your functionality will be disabled for an hour. If you exceed the limit for a 7th time in the same period it will be disabled for 2 hours, 8th time for 3 hours, and so on until you hit a maximum of 5 hours which is the maximum penalty time. Thereafter, each time you exceed the limit, you will be locked out for 5 hours.

As days go by, if you reach the EPS limit violation of 5 times or less in the past 7 consecutive days, you become compliant and the features that were disabled automatically get enabled.

## Chapter 2

# Configuration

---

This chapter describes the various tasks that you can perform to manage the component configuration. The following topics are covered in this chapter:

- [“Managing and Changing Properties File Settings” on page 13](#)
- [“Adjusting Console Memory” on page 18](#)
- [“Adjusting Pattern Discovery Memory” on page 18](#)
- [“Installing New License Files Obtained from ArcSight” on page 19](#)
- [“Configuring ArcSight Manager Logging” on page 20](#)
- [“Understanding SSL Authentication” on page 30](#)
- [“Reconfiguring the ArcSight Console after Installation” on page 70](#)
- [“Reconfiguring ArcSight Manager” on page 70](#)
- [“Manager Password Configuration” on page 71](#)

## Managing and Changing Properties File Settings

Various components of ArcSight Express v3.0 use properties files for configuration. Many sections of this documentation require you to change properties in those files. Some of the properties files are also modified when you use one of the configuration wizards.

### Property File Format

Generally, all properties files are text files containing pairs of keys and values. The keys determine which setting is configured and the value determines the configuration value. For example, the following property configures the port on which ArcSight Manager listens:

```
servletcontainer.jetty311.encrypted.port=8443
```

Blank lines in this file are ignored as well as lines that start with a pound sign ( # ). Lines that start with a pound sign are used for comments.

### Defaults and User Properties

Most configuration items in various components consist of at least two files. The first, generally referred to as the defaults properties file, contains the default settings that

ArcSight Express v3.0 provides. These files should never be modified, but can be used as a reference. Updates to the components will overwrite this file to include new settings.

The second file, generally referred to as the user properties file, contains settings that are specific to a particular installation. Settings in the user properties file override settings in the defaults properties file. Typically, the user properties file for a component is created and modified automatically when you configure the component using its configuration wizard. Because the user properties file contains settings you specify to suit your environment, it is never replaced by an upgrade.

The following table lists the most important properties files.

| Default Properties                                       | User Properties                          | Purpose                        |
|--|--|--------------------------------|
| <code>config/<br/>server.defaults.properties</code>      | <code>config/server.properties</code>    | ArcSight Manager Configuration |
| <code>config/<br/>console.defaults.properties</code>     | <code>config/console.properties</code>   | ArcSight Console Configuration |
| <code>config/<br/>client.defaults.properties</code>      | <code>config/client.properties</code>    | ArcSight Common Client Config  |
| <code>config/agent/<br/>agent.defaults.properties</code> | <code>user/agent/agent.properties</code> | SmartConnector Configuration   |

## Editing Properties

You can edit the properties using a regular text editor, for example vi or emacs.

If you configured the Console and SmartConnectors using default settings in the configuration wizard, a user properties file is not created automatically for that component. If you need to override a setting on such a component, use a text editor to create this file in the directory specified in the above table.

When you edit a property on a component, you must restart the component for the new values to take effect except for the Manager properties listed in the next section.

If you change a communication port, be sure to change both sides of the connection. For example, if you configure a Manager to listen to a different port than 8443, be sure to configure all the Manager's clients (Consoles, SmartConnectors, ArcSight Web, and so on) to use the new port as well.

| Protocol | Port | Configuration   |
|----------|------|---|
| TCP      | 8443 | ArcSight Console to ArcSight Manager communication        |
| TCP      | 8443 | ArcSight SmartConnector to ArcSight Manager communication |
| TCP      | 9443 | ArcSight Web  |
|          | 9090 | ESM Service Layer Container Port                          |
| TCP      | 389  | ArcSight Manager to LDAP server (w/o SSL if enabled)*     |
| TCP      | 636  | ArcSight Manager to LDAP server (w/ SSL if enabled)*      |
| TCP      | 25   | ArcSight Manager to SMTP server (for Notifications)       |

| Protocol | Port         | Configuration  |
|----------|--------------|--|
| TCP      | 110          | ArcSight Manager to POP3 server (for Notifications)          |
| TCP      | 143          | ArcSight Manager to IMAP server (for Notifications)          |
| UDP      | 1645 or 1812 | ArcSight Manager to RADIUS server (if enabled)               |
| UDP/TCP  | 53           | ArcSight Console to DNS Server communication (nslookup tool) |
| UDP/TCP  | 43           | ArcSight Console to Whois Server communication (whois tool)  |
| ICMP     | none         | ArcSight Console to Target communication (ping tool)         |

## Dynamic Properties

When you change the following properties in the `server.properties` file on the Manager, you do not need to restart the Manager for the changes to take effect:

- `auth.auto.reenable.time`
- `auth.enforce.single.sessions.console`
- `auth.enforce.single.sessions.web`
- `auth.failed.max`
- `auth.password.age`
- `auth.password.age.exclude`
- `auth.password.different.min`
- `auth.password.length.max`
- `auth.password.length.min`
- `auth.password.letters.max`
- `auth.password.letters.min`
- `auth.password.maxconsecutive`
- `auth.password.maxoldsubstring`
- `auth.password.numbers.max`
- `auth.password.numbers.min`
- `auth.password.others.max`
- `auth.password.others.min`
- `auth.password.regex.match`
- `auth.password.regex.reject`
- `auth.password.unique`
- `auth.password.userid.allowed`
- `auth.password.whitespace.max`
- `auth.password.whitespace.min`
- `external.export.interval`
- `process.execute.direct`
- `servletcontainer.jetty311.log`
- `servletcontainer.jetty311.socket.https.expirationwarn.days`

- `ssl.debug`
- `web.accept.ips`
- `whine.notify.emails`
- `xmlrpc.accept.ips`

After you make the change, you use the `manager-reload-config` command to load those changes to the Manager. Every time the `manager-reload-config` command is successful, a copy of the `server.properties` file it loaded is placed in `<ARCSIGHT_HOME>/config/history` for backup purposes. The `server.properties` file in `<ARCSIGHT_HOME>/config/history` is suffixed with a timestamp and does not overwrite the existing versions, as described in the following example.

## Example

Manager M1 starts successfully for the first time on September 27, 2010, at 2:45 p.m. A backup copy of its `server.properties` file is written to `<ARCSIGHT_HOME>/config/history` with this timestamp:

```
server.properties.2010_09_27_14_45_27_718
```

On September 28, 2010, the M1 administrator adds the following property to the `server.properties` file:

```
notification.aggregation.max_notifications=150
```

When the administrator runs the `manager-reload-config` command at 1:05 p.m. the same day, it runs successfully because this property can be loaded dynamically.

As soon as the updated `server.properties` file is loaded in M1's memory, a backup copy of the updated `server.properties` file is written to `<ARCSIGHT_HOME>/config/history` with appropriate timestamp.

Now, `<ARCSIGHT_HOME>/config/history` contains these two backup files:

```
server.properties.2010_09_27_14_45_27_718
```

```
server.properties.2010_09_28_01_05_40_615
```

On September 29, 2010, the M1 administrator adds this property to the `server.properties` file:

```
notification.aggregation.time_window=2d
```

As this property can be also loaded dynamically, similar to the previous change, once the updated `server.properties` is loaded in M1's memory, a backup copy of the `server.properties` file is written to `<ARCSIGHT_HOME>/config/history` with appropriate timestamp.

Now, `<ARCSIGHT_HOME>/config/history` contains these three backup files:

```
server.properties.2010_09_27_14_45_27_718
```

```
server.properties.2010_09_28_01_05_40_615
```

```
server.properties.2010_09_29_03_25_45_312
```

On September 30, 2010, the M1 administrator updates the `whine.notify.emails` property in the `server.properties` file. When he runs the `manager-reload-config`

command, the command fails because this property cannot be loaded dynamically. As a result, these things happen:

- The updated `server.properties` file is not loaded into M1's memory, however, changes made to it are not reverted.
- M1 continues to use the properties that were loaded on September 29th.
- No backup copy is made. The `<ARCSIGHT_HOME>/config/history` directory continues to contain the same three backup files:

```
server.properties.2010_09_27_14_45_27_718
server.properties.2010_09_28_01_05_40_615
server.properties.2010_09_29_03_25_45_312
```

The changes made on September 30th will not be effective until M1 is restarted.

## Changing Manager Properties Dynamically

To change any of the properties listed previously, do these steps:

- 1 Change the property in the `server.properties` file and save the file.
- 2 **(Optional)** Use the `-diff` option of the `manager-reload-config` command to view the difference between the server properties the Manager is currently using and the properties that will be loaded after you run this command:

```
arcsight manager-reload-config -diff
```

**Note**

The `-diff` option compares all server properties—default and user properties. For all options available with the `manager-reload-config` command, see [Appendix A, ArcSight Commands](#), on page 87.

- 3 Run this command in `<ARCSIGHT_HOME>/bin` to load the new values for the properties you changed:

```
arcsight manager-reload-config
```

If this command fails with a warning, it indicates that you are changing properties that require a Manager restart before those changes can take effect. When you get such a warning none of the property changes, including the ones that can be reloaded without restarting the Manager, are applied. You can do one of the following in this situation:

- Revert changes to properties that cannot be loaded without restarting the Manager and rerun the `arcsight manager-reload-config` command.
- Force an update of all properties using the `-as` option, as follows:

```
arcsight manager-reload-config -as
```

When you use the `-as` option, the properties that can be changed without restarting the Manager take effect immediately. The properties that require a Manager restart are updated in the `server.properties` but are not effective until the Manager is restarted.

For example, if you change `auth.password.length.min` to 7 and `search.enabled` to false, you will get the above warning because only `auth.password.length.min` can be updated without restarting the Manager. If you force an update of the `server.properties` file,

`auth.password.length.min` will be set to 7, but `search.enabled` will continue to be set to true until the Manager is restarted.

Be careful in using the `-as` option to force reload properties. If an invalid static change is made, it may prevent the Manager from starting up once it reboots.

## Changing the Service Layer Container Port

By default the service layer container port is 9090. You can change this port :

- 1 Modifying the following files located in the Manager's `<ARCSIGHT_HOME>`:

- ◆ `/arcsight-dm`  
`/plugins/com.arcsight.dm.plugins.tomcatServer_1.0.0/conf/server.xml.`
- ◆ `/config/proxy.rule.xml`
- ◆ `/config/rewriteProxy.rule.xml`

Make sure to replace the references to port 9090 with an unused port number.

- 2 Restart the Manager.

## Securing the ArcSight Manager Properties File

The ArcSight Manager's `server.properties` file contains sensitive information such as database passwords, keystore passwords, and so on. Someone accessing the information in this file can do a number of things, such as tampering with the database and acting as a pseudo ArcSight Manager. As a result, the `server.properties` file must be protected so that only the user account under which the ArcSight Manager is running is able to read it. This can be accomplished by issuing a `chmod` command, for example:

```
chmod 600 server.properties
```

This operation is performed during the ArcSight Manager installation. As a result, only the owner of the file (which must be the user that runs the ArcSight Manager) may read or write to the file. For all other users, access to the file is denied.

## Adjusting Console Memory

Because the ArcSight Console can open up to ten independent event-viewing channels, out-of-memory errors may occur. If such errors occur, or if you simply anticipate using numerous channels for operations or analysis, please make the following change to each affected Console installation.

In the `bin/scripts` directory, in the `console.sh` configuration files, edit the memory usage range for the Java Virtual Machine.

## Adjusting Pattern Discovery Memory

By default, Pattern Discovery limits its memory usage to about 4 GB of memory. However, if the search for patterns involves too many transactions and events, the task can run out of memory and abort. You can control the memory limit indirectly by changing the maximum number of transactions and events the Pattern Discovery task can hold in memory. The settings for these values are in the `server.defaults.properties` file in the `config` folder.

- `patterns.transactionbase.max` — The maximum number of transactions allowed in memory. If you exceed this number, these transactions are stored as page file. The default is 10000.
- `patterns.maxSupporterCost` — The maximum number of supporters allowed in memory. If you exceed this number, the pattern discovery task aborts. The default is 80000.
- `patterns.maxUniqueEvents` — The maximum number of unique events allowed in memory. If you exceed this number, the pattern discovery task aborts. The default is 20000.

If the pattern discovery task aborts, a message to that effect appears in the console. Run the pattern discovery task again after increasing the pattern discovery memory usage limits. You can increase the memory usage limit by increasing the three values proportionally. For example, to add 25 percent more memory capacity, you would change the values to:

- `patterns.transactionbase.max=12500`
- `patterns.maxSupporterCost=100000`
- `patterns.maxUniqueEvents=25000`

You can edit the properties file using a regular text editor. After changing any of these values, restart the manager for them to take effect.

## Installing New License Files Obtained from ArcSight

To change the license file you obtained from ArcSight, please follow the steps below:

You will receive new license files packaged as `.zip` files and sent via e-mail from ArcSight.

- 1 On the system where ArcSight Manager is installed, copy the package (`.zip` file) to the `<ARCSIGHT_HOME>` directory (the directory that contains the ArcSight Manager installation).
- 2 Run the following command from the Manager's `/bin` directory:
 

```
./arcsight deploylicense
```
- 3 Restart the Manager by running:
 

```
/sbin/service arcsight_services restart manager
```

This wizard replaces the license currently installed with the one included in the file. The Manager detects the new license automatically.

## Installing in Silent Mode

To install the license file in silent mode, you are required to create a properties file and use it. To do so:

- 1 Open a command prompt/shell window.
- 2 From the Manager's `bin` directory, run the following command to open the sample properties file:
 

```
./arcsight deploylicense -g
```

3 Copy and paste the text generated by the command above into a text file.

4 Set the following properties:

```
LicenseChoice=1

LicenseFile.filename=<name_of_the_license_zip_file>

replaceLicenseQuestion =yes
```

5 Save this text file as `properties.txt` in the Manager's `<ARCSIGHT_HOME>`.

6 From the Manager's `bin` directory, run:

```
./arcsight deploylicense -f properties.txt -i silent
```

## Configuring ArcSight Manager Logging

ArcSight Manager outputs various types of information to log files. By default, the logs are located in:

```
<ARCSIGHT_HOME>/logs/default/
```

Various ArcSight Manager utilities write logging information to different sets of log files. Each of those sets can consist of multiple files.

The number and size of the log files are configurable, a typical setting is 10 files with 10 megabytes each. When a log file reaches a maximum size, it is copied over to a different location. Depending on your system load, you may have to change the default settings. To make changes to the logging configuration, change the log channel parameters. The default log channel is called *file*.

For the main ArcSight Manager log file, called `server.log`, the following `server.properties` settings are used:

```
# Maximum size of a log file.

log.channel.file.property.maxsize=10MB

# Maximum number of roll over files.

log.channel.file.property.maxbackupindex=10
```

The first setting affects the size of each individual log file; the second setting affects the number of log files created. The log file currently in use is always the log file with no number appended to the name. The log file with the largest number in its extension is always the oldest log file. All of the log files are written to the `<ARCSIGHT_HOME>/logs/default` directory.

ArcSight Manager and its related tools write the following log files:

| Log File                         | Description  |
|----------------------------------|--|
| <code>server.log*</code>         | The main ArcSight Manager log.   |
| <code>server.status.log*</code>  | System status information, such as memory usage etc.                                 |
| <code>server.channel.log*</code> | Active Channel logs.   |
| <code>server.std.log*</code>     | All output that ArcSight Manager prints on the console (if run in command line mode) |

| Log File                       | Description   |
|--------------------------------|---|
| <code>server.pulse.log*</code> | ArcSight Manager writes a line to this set of logs every ten seconds. Used to detect service interruptions. |
| <code>server.sql.log*</code>   | If database tracing is enabled, the SQL statements are written to this set of log files.                    |
| <code>execproc.log*</code>     | Log information about externally executed processes (only on some platforms)                                |
| <code>serverwizard.log*</code> | Logging information from the arcsight managersetup utility.   |
| <code>dbwizard.log*</code>     | Logging information from the arcsight database init utility.  |

## Sending logs and diagnostic information to ArcSight

ArcSight Customer Support may request log files and other diagnostic information to troubleshoot problems. The Send Logs utility automatically locates the log files and compresses them. You will need to send the compressed files to the ArcSight Customer Support server.

- You can run this utility as a wizard directly from the Console interface (GUI) in addition to the command-line interface of each component.
- Optionally, gather diagnostic information such as session wait times, thread dumps, and database alert logs about your ArcSight system, which helps ArcSight Customer Support analyze performance issues on your ArcSight components.

You can also use the `arcdt` command to run specific diagnostic utilities from the Manager command line. For more information, see [Appendix A, ArcSight Commands, on page 87](#).

- When you run this utility from the Console, Manager, or Web, you can gather logs and diagnostic information for all components of the system.

## Guidelines for using the Send Logs utility

Keep these guidelines in mind when using the Send Logs utility:

- You can be connected as any valid user on an ArcSight component to collect its local logs; however, you must have administrator access to collect logs from other components. For example, if you are connected as user 'joe' to the Console, you can collect its logs. But if you need to collect logs for the Manager and the database, you must connect to the Console as the ArcSight administrator.
- SmartConnectors must be running version 4037 or later to remotely (using a Console or the Manager) collect logs from them.
- You can only collect local logs on SmartConnectors or the CORR-Engine. That is, if you run the Send Logs utility on the CORR-Engine, only the CORR-Engine log files are gathered. In order to collect the CORR-Engine logs, the Manager needs to be running.
- You can run the Send Logs utility on a component that is down. That is, if the Database is down, you can still collect its logs using this utility.

If the Manager is down, you can only collect its local logs. However, if you need to collect the database logs as well, use the `arcdt` command on the Manager. For more information, see [Appendix A, ArcSight Commands, on page 87](#).

- All log files for a component are gathered and compressed. That is, you cannot select a subset of log files that the utility should process.
- The Send Logs utility generates a compressed file on your local system that you can send to ArcSight Customer Support by e-mail.
- You can review the compressed file to ensure that only a desired and appropriate amount of information is sent to ArcSight support.
- You can remove or sanitize information such as IP addresses, host names, and e-mail addresses from the log files before compressing them. The options are:

- ◆ Send log as generated

This option, the default, does not remove any information from the logs files.

- ◆ Only remove IP address

This option removes IP addresses, but not host names or e-mail addresses, from the logs files.

- ◆ Remove IP address, host names, e-mail addresses

This option removes all IP addresses and enables you to specify a list of host-name suffixes for which all host names and e-mail addresses will be removed from the logs.

For example, if you specify '[company.com](#)' as a host-name suffix to remove, the Send Logs utility will remove all references to domains such as '[www.company.com](#)' and e-mail addresses such as '[john@company.com](#)' from the logs.

## Gathering logs and diagnostic information

When you run the Send Logs utility on ArcSight SmartConnectors, it gathers logs and diagnostic information (if applicable) for only those components. However, when you run this utility on ArcSight Console, Manager, or ArcSight Web, you can gather logs and diagnostic information for all or a selected set of ArcSight components.

To run this utility on SmartConnectors, enter this in `<ARCSIGHT_HOME>/bin`:

```
./arcsight agent sendlogs
```

To gather logs and diagnostic information for all or a selected set of components, do one of the following:

- On the ArcSight Console, click **Tools | SendLogs**.
- Enter this command in `<ARCSIGHT_HOME>/bin` on Console, Manager, or Web:

```
./arcsight sendlogs
```

The above action starts the Send Logs wizard. In the wizard screens, perform these steps:

The Send Logs wizard remembers most of the choices you make when you run it for the first time. Therefore, for subsequent runs, if you choose to use the previous settings, you will need to enter only some of the following information.

---

- 1 Decide whether you want the wizard to gather logs only from the component on which you are running it or from all components.

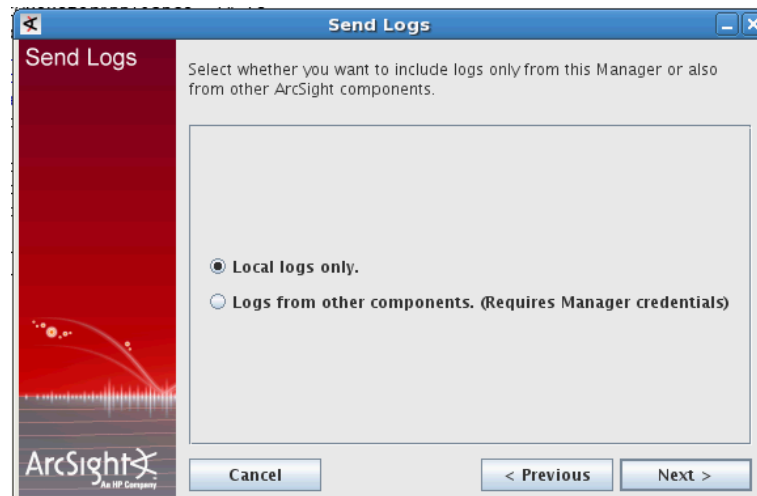

If you select **Use current settings to gather logs.** logs for all components will be gathered thus: If this is the first sendlogs is run after installation, then all the logs are gathered. If this is not the first sendlogs is run, then it will use the same setting as the previous run.

- a You will be asked to enter the Manager's login information.
- b Go to [Step 2 on page 27](#).

If you selected **Change/Review settings before gathering logs.** you will be provided the option to select the components for which you want logs gathered.

Select whether you want only the local (the component from where you ran the Send Logs utility) logs selected or you want logs from other components collected too.

**Local logs only:**

If you selected **Local logs only**, you will be prompted to either choose a time range or include all time ranges.

If you selected **Include all time ranges**, go to [Step 2 on page 27](#).

If you selected **Choose a specific time range**, you will be prompted to enter a start time and end time - a time range for which the wizard will gather the logs.

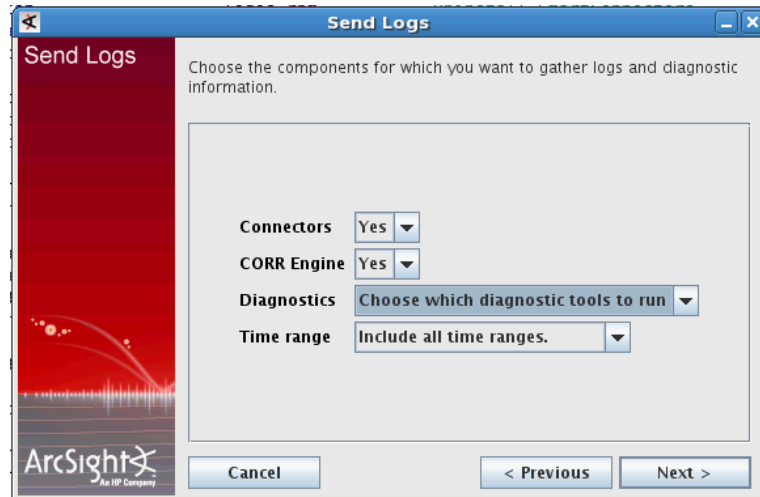

Go to [Step 2 on page 27](#).

#### **Logs from other components (Requires Manager credentials):**

If you selected **Logs from other components (Requires Manager credentials)**, you will be prompted to choose the components.

- a Select the components and the time range for which you want to gather logs. In addition, select whether you want to run the diagnostic utilities to gather additional information for those components.

If you choose to specify the diagnostic utilities to run, you will be prompted to select the utilities from a list in a later screen. The diagnostic utilities you can select are:

- ◆ **runsql**—Run SQL commands contained in a file that is specified as a parameter of this utility.

For example, to use the **runsql** utility to find out the number of cases in your Database, do the following:

- i Create a file called **sample.txt** in **<ARCSIGHT\_HOME>/tmp** on the Manager with this SQL command:

```
select count(*) from arc_resource where resource_type=7;
```

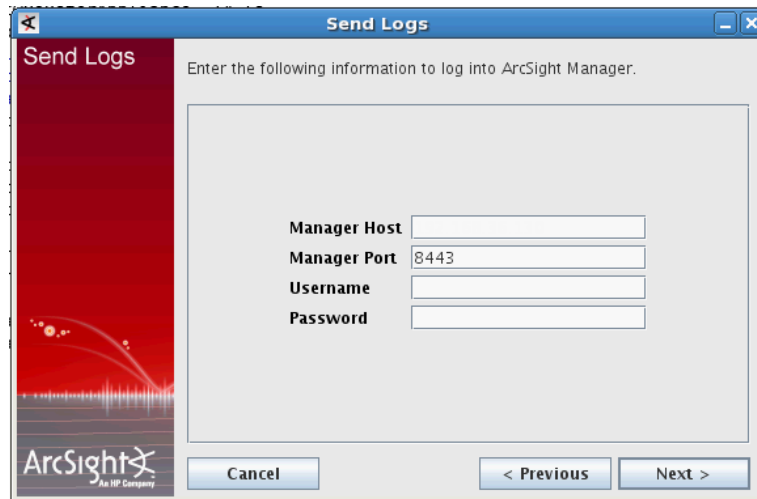

- ii Run this command:

```
arcdt runsql <ARCSIGHT_HOME>/tmp/sample.txt
```

- ◆ **session-waits**—Retrieve the currently running JDBC (Java Database Connection) sessions and their wait times.
- ◆ **thread-dumps**—Obtain thread dumps from the Manager.

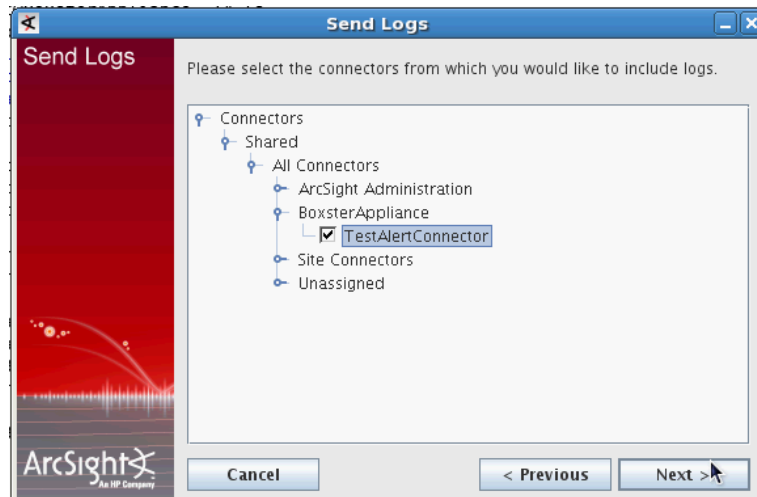

For more details on these commands, see the [Appendix A, arcdt](#), on page 92.

- b Enter information to log in to your ArcSight Manager.

The 'Send Logs' dialog box has a blue title bar and a red sidebar with the ArcSight logo. The main area is light gray and contains the text 'Enter the following information to log into ArcSight Manager.' Below this text are four input fields: 'Manager Host', 'Manager Port' (with '8443' entered), 'Username', and 'Password'. At the bottom are three buttons: 'Cancel', '< Previous', and 'Next >'.

- c If you chose to gather logs from the SmartConnectors, select those SmartConnectors in the next screen.

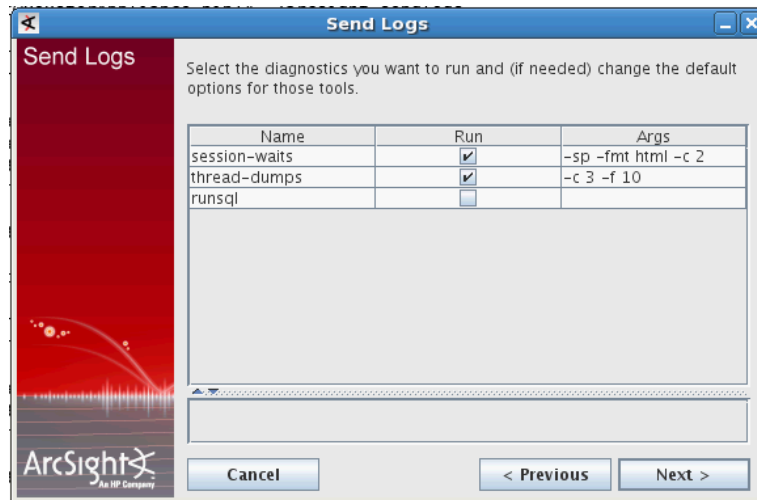

The 'Send Logs' dialog box has a blue title bar and a red sidebar with the ArcSight logo. The main area is light gray and contains the text 'Please select the connectors from which you would like to include logs.' Below this text is a tree view showing a hierarchy of connectors: 'Connectors' (expanded) -> 'Shared' (expanded) -> 'All Connectors' (expanded) -> 'ArcSight Administration' (expanded) -> 'BoxsterAppliance' (expanded) -> 'TestAlertConnector' (checked). Other connectors listed are 'Site Connectors' and 'Unassigned'. At the bottom are three buttons: 'Cancel', '< Previous', and 'Next >'.

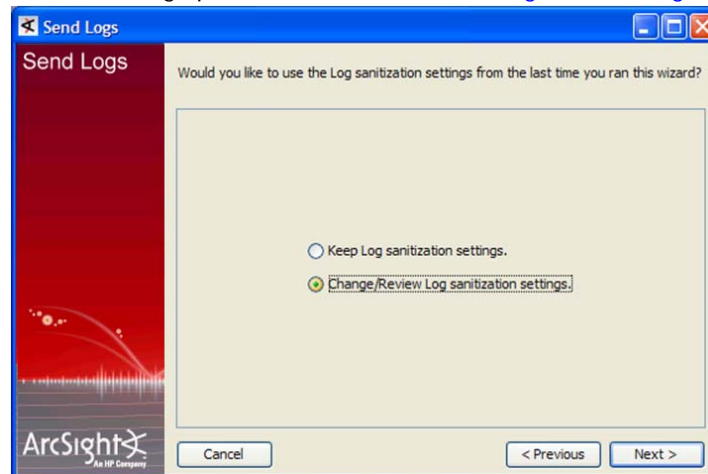

At a minimum, the SmartConnectors should be running version 4037 or later.

- d If you chose to select the diagnostic utilities you want to run earlier in this wizard, select them in the next screen.

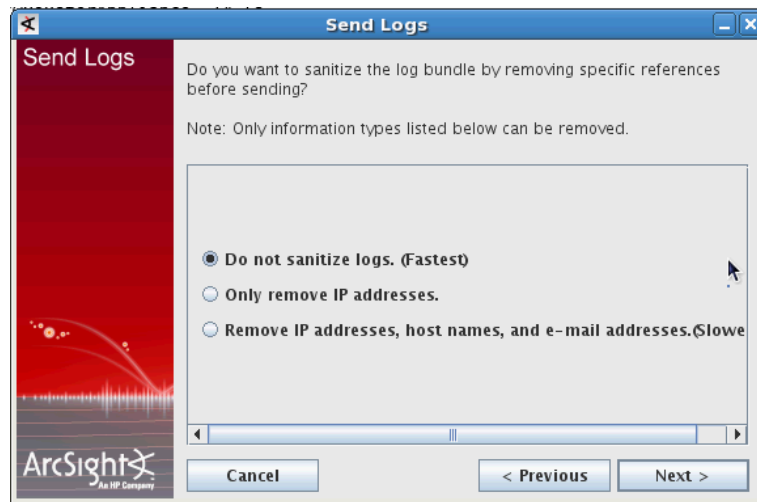

- e Go to [Step 2 on page 27](#).

- 2 Select whether you want to sanitize the logs before sending. For more information about sanitizing options, see [“Guidelines for using the Send Logs utility” on page 21](#).

If you choose **Keep Log sanitization settings**, go to [Step 3 on page 29](#).

If you choose **Change/Review Logs sanitization settings**, you will be prompted to select what you want to sanitize.

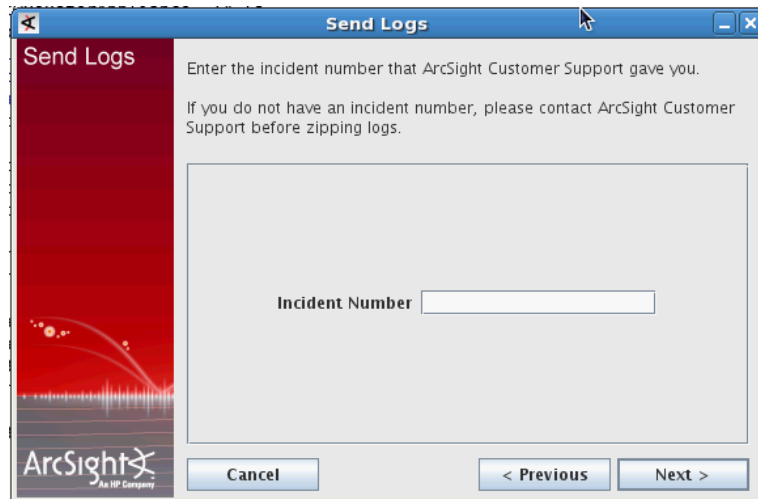

If you chose either option #1 or #2, go to [Step 3 on page 29](#).

If you selected **Remove IP addresses, host names, and e-mail addresses (Slower)**, you will be prompted to enter what you want removed.

3 Enter the ArcSight Support incident number.

The 'Send Logs' dialog box has a blue title bar and a red sidebar with the ArcSight logo. The main area contains the following text:

Enter the incident number that ArcSight Customer Support gave you.

If you do not have an incident number, please contact ArcSight Customer Support before zipping logs.

Below the text is a text input field labeled 'Incident Number'.

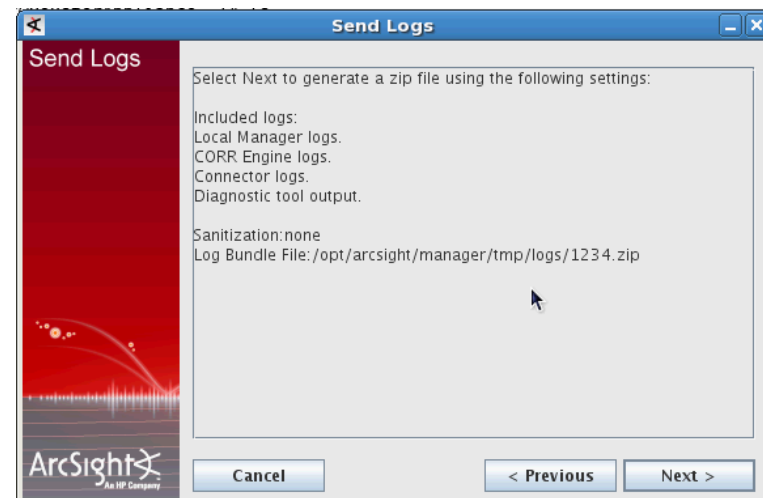

At the bottom are three buttons: 'Cancel', '< Previous', and 'Next >'.

The Send Logs utility uses this number to name the compressed file it creates. Use the incident number that ArcSight Customer Support gave you when you reported the issue for which you are sending the logs. Doing so helps Customer Support easily relate the compressed file to your incident.

In case you do not have an incident number at this time, you can continue by entering a meaningful name for the compressed file to be created and once you obtain the incident number from ArcSight Customer Support, you can rename the file with the incident number you received.

If you have not reported an incident for which you are sending the logs, ArcSight strongly recommends that you do so before packing the logs.

4 Click **Next** to start the compression.

The 'Send Logs' dialog box shows the next step in the wizard. The main area contains the following text:

Select Next to generate a zip file using the following settings:

Included logs:  
 Local Manager logs.  
 CORR Engine logs.  
 Connector logs.  
 Diagnostic tool output.

Sanitization: none  
 Log Bundle File: /opt/arcSight/manager/tmp/logs/1234.zip

At the bottom are three buttons: 'Cancel', '< Previous', and 'Next >'.

Most of the values you entered during the first run of the Send Logs wizard are retained. The next time you run this wizard, you need to enter only a few settings.

- 5 Click **Finish** in the last screen.

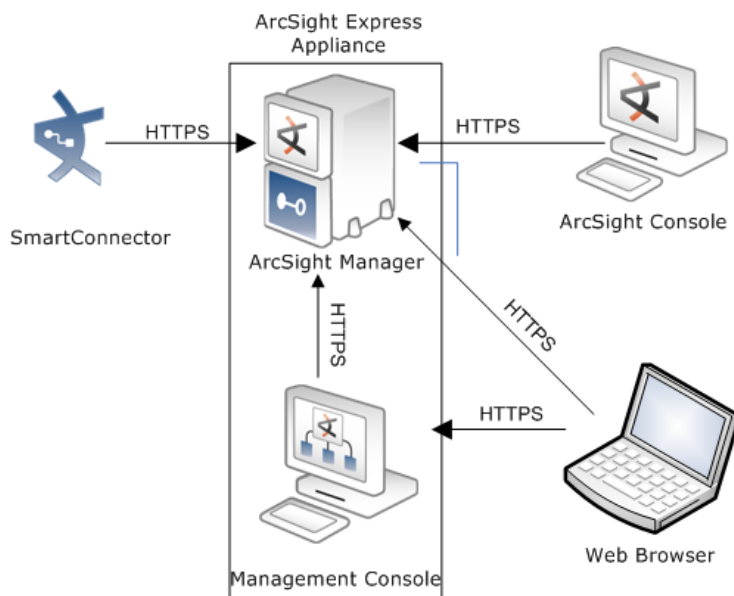

## Understanding SSL Authentication

Secure Socket Layer (SSL) technology is used for communication between ArcSight Manager and its clients—Console, SmartConnectors, and ArcSight Web. SSL is also used between ArcSight Web and the web browsers that communicate with it.

SSL enables the Manager and ArcSight Web (referred to as a “server” from here on) to authenticate to its clients and communicate information over an encrypted channel, thus providing the following benefits:

- Authentication—Ensuring that clients send information to an authentic server and not to a machine pretending to be that server.
- Encryption—Encrypting information sent between the clients and the server.
- Data Integrity—Hashing information to prevent intentional or accidental modification.

By default, clients submit a valid user name and password to authenticate with the server; however, these clients can be configured to use SSL client authentication.

## Terminology

These terms are used in describing and configuring SSL:

- **Certificate**

A certificate contains the public key, identifying information about the machine such as machine name, and the authority that signs the certificate. SSL certificates are defined in the ISO X.509 standard.

- **Key pair**

A key pair is a combination of a private key and the public key that encrypts and decrypts information. A machine shares only its public key with other machines; the private key is never shared. The public and private keys are used to set up an SSL session. For details, see [“How SSL Works” on page 40](#).

**Note**

The [keytoolgui](#) utility, used to perform a number of SSL configuration tasks, refers to a combination of an SSL certificate and private key as the key pair.

The [keytoolgui](#) utility is discussed in [“Tools for SSL configuration” on page 35](#).

- **SSL server-SSL client**

An SSL session is set up between two machines—one of them acts as the server and the other as a client. Typically, a server must authenticate to its clients before they will send any data. However, in client-side SSL authentication, the server and its clients authenticate each other before communicating.

ArcSight Manager is an SSL server, while SmartConnectors, Console, and browsers are SSL clients. ArcSight Web is an SSL client to the Manager and an SSL server to the web browsers that connect to it.

- **Key store**

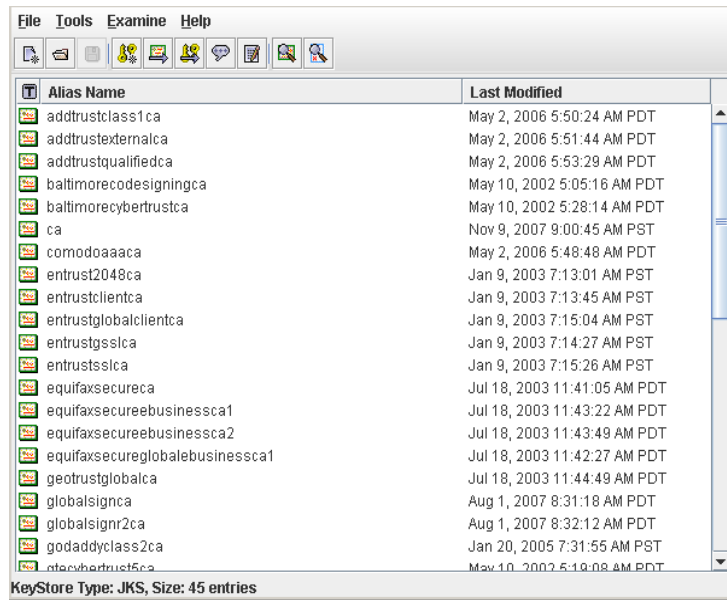

A key store is an encrypted repository on the SSL server that holds the SSL certificate and the server's private key. The following table lists the ArcSight component, the name of the key store on that component, and its location.

| Log File                                  | Key Store File Name**           | Location of Key Store                              |
|---|---------------------------------|--|
| Manager                                   | <a href="#">keystore</a>        | <a href="#">&lt;ARCSIGHT_HOME&gt;/config/jetty</a> |
| ArcSight Web                              | <a href="#">webkeystore</a>     | <a href="#">&lt;ARCSIGHT_HOME&gt;/config/jetty</a> |
| Clients* (for client-side authentication) | <a href="#">keystore.client</a> | <a href="#">&lt;ARCSIGHT_HOME&gt;/config</a>       |

\*When client-side authentication is used, a key store exists on both—the server and the client.

\*\*Make sure you do not change the keystore file name.

## ■ Trust store

Trust store is an encrypted repository on SSL clients that contains a list of certificates of the issuers that a client trusts.

The [keytoolgui](#) utility, used to view a trust store, is discussed in [“Tools for SSL configuration”](#) on page 35.

When an issuer issues a certificate to the server, it signs the certificate with its private key. When the server presents this certificate to the client, the client uses the issuer's public key from the certificate in its trust store to verify the signature. If the signature matches, the client accepts the certificate. For more details, see how SSL handshake occurs in [“How SSL Works”](#) on page 40.

The following table lists the ArcSight component, the name of the trust store on that component, and its location.

| Component    | Trust Store File Name | Location of Trust Store          |
|--------------|-----------------------|----------------------------------|
| Clients      | cacerts               | <ARCSIGHT_HOME>/jre/lib/security |
| Manager      | cacerts[1]            | <ARCSIGHT_HOME>/jre/lib/security |
| ArcSight Web | cacerts               | <ARCSIGHT_HOME>/jre/lib/security |
| Manager      | truststore[2]         | <ARCSIGHT_HOME>/config/jetty     |
| ArcSight Web | webtruststore[2][3]   | <ARCSIGHT_HOME>/config/jetty     |

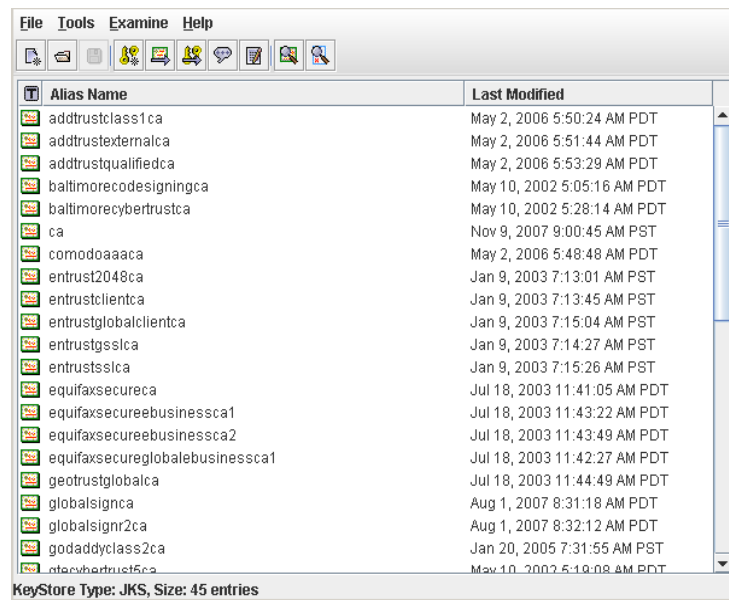

[1] The utilities that exist on the Manager machine such as archive are treated as clients of the Manager. The cacerts file on the Manager is used for authenticating the Manager to these clients.

[2] When client-side authentication is used.

[3] When client-side authentication is used, ArcSight Web contains two trust stores—cacerts for connections to the Manager and webtruststore for connections to browsers.

## ■ Alias

Certificates and key pairs in a key store or a trust store are identified by an alias.

## ■ Key store / Trust store password

A key store password is used to encrypt the key store file. Similarly, a trust store password is used to encrypt a trust store file. Without this password, you cannot open these files.

You specify a key store password when creating a key pair, which is discussed in later sections of this chapter. The password is obfuscated and stored in the ArcSight component's `*.properties` file. The following table lists the property file and the property name where the key store password is stored for each component.

A default trust store password is set up for each ArcSight component in its `*.defaults.properties` file. The password is unobfuscated. Typically, you will not need to change this password. However, if you want to change or obfuscate this password, use the `changepassword` utility. For information about `changepassword`, see Appendix A. The following table lists the property name where the obfuscated trust store password is stored.

| Password Type | Property File                     | Property Name  |
|---------------|-----------------------------------|--|
| Key Store     |                                   |  |
| Manager       | <code>server.properties</code>    | <code>server.privatekey.password.encrypted</code>                    |
| ArcSight Web  | <code>webserver.properties</code> | <code>server.privatekey.password.encrypted</code>                    |
| Client*       | <code>client.properties**</code>  | <code>ssl.keystore.password.encrypted</code>                         |
| Trust Store   |                                   |  |
| Client        | <code>client.properties**</code>  | <code>ssl.truststore.password</code>                                 |
| Manager*      | <code>server.properties</code>    | <code>servletcontainer.jetty311.truststore.password.encrypted</code> |

| Password Type | Property File                     | Property Name  |
|---------------|-----------------------------------|--|
| ArcSight Web  | <code>webserver.properties</code> | <code>servletcontainer.jetty311.truststore.password.encrypted</code> |

\*For client-side authentication

\*\* If the `client.properties` file does not exist on your client, you will need to create it using an editor of your choice.

#### ■ Cipher suite

A set of authentication, encryption, and data integrity algorithms used for securely exchanging data between an SSL server and a client.

The following cipher suites are enabled by default:

- ◆ TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA
- ◆ SSL\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA
- ◆ SSL\_RSA\_WITH\_RC4\_128\_MD5
- ◆ SSL\_RSA\_WITH\_RC4\_128\_SHA

Other supported cipher suites are:

- ◆ TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA
- ◆ TLS\_DHE\_DSS\_WITH\_AES\_128\_CBC\_SHA
- ◆ SSL\_DHE\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA
- ◆ SSL\_DHE\_DSS\_WITH\_3DES\_EDE\_CBC\_SHA
- ◆ SSL\_RSA\_WITH\_DES\_CBC\_SHA
- ◆ SSL\_DHE\_RSA\_WITH\_DES\_CBC\_SHA
- ◆ SSL\_DHE\_DSS\_WITH\_DES\_CBC\_SHA
- ◆ SSL\_RSA\_EXPORT\_WITH\_RC4\_40\_MD5
- ◆ SSL\_RSA\_EXPORT\_WITH\_DES40\_CBC\_SHA
- ◆ SSL\_DHE\_RSA\_EXPORT\_WITH\_DES40\_CBC\_SHA
- ◆ SSL\_DHE\_DSS\_EXPORT\_WITH\_DES40\_CBC\_SHA
- ◆ SSL\_RSA\_WITH\_NULL\_MD5
- ◆ SSL\_RSA\_WITH\_NULL\_SHA
- ◆ SSL\_DH\_anon\_WITH\_RC4\_128\_MD5
- ◆ TLS\_DH\_anon\_WITH\_AES\_128\_CBC\_SHA
- ◆ SSL\_DH\_anon\_WITH\_3DES\_EDE\_CBC\_SHA
- ◆ SSL\_DH\_anon\_WITH\_DES\_CBC\_SHA
- ◆ SSL\_DH\_anon\_EXPORT\_WITH\_RC4\_40\_MD5
- ◆ SSL\_DH\_anon\_EXPORT\_WITH\_DES40\_CBC\_SHA

Although in most cases you do not need to change cipher suites, you can configure them in the properties file for an ArcSight component:

- ◆ Manager—`server.properties`
- ◆ Arcsight Web—`webserver.properties`
- ◆ Clients—`client.properties`

During the SSL handshake, the client provides a list of cipher suites that it can accept, in descending order of preference. The server compares the list with its own set of acceptable cipher suites, picks one to use based on its order of preference, and communicates it to the client.

## Tools for SSL configuration

### Keytoolgui

The `keytoolgui` utility enables you to perform a number of SSL configuration tasks. Some of these tasks are:

- Creating a new key store
- Creating a new key pair
- Creating a request for a CA-signed certificate (`.csr` file)
- Exporting and Importing a key pair
- Exporting and Importing a certificate

The `keytoolgui` utility is available on all components and is located in the `<ARCSIGHT_HOME>/bin/scripts` directory of the component.

Be sure to have X11 enabled to run this tool.

To run `keytoolgui`, run this command in `<ARCSIGHT_HOME>/bin`:

```
./arcsight keytoolgui
```

On SmartConnectors, use:

```
./arcsight agent keytoolgui
```

### Using Keytoolgui to Export a Key Pair

1 Start the keytoolgui by running the following from the Manager's `bin` directory:

```
./arcsight keytoolgui
```

2 Click **File->Open KeyStore** and navigate to the component's keystore.

3 Enter the password for the keystore when prompted. The default password is "changeit" (without quotes).

4 Right-click the key pair and select **Export**.

5 Select **Private Key and Certificates** radio button and click **OK**.

6 Enter the password for the key pair when prompted. The default password is "changeit" (without quotes).

7 Enter a new password which will be used for the exported key pair file, then re-enter it to confirm it and click **OK**.

8 Navigate to the location on your machine to where you want to export the key pair.

9 Enter a name for the key pair with a `.pfx` extension in the Filename textbox and click **Export**.

10 You will see an Export Successful message.

- 11 Click **OK**.

### Using Keytoolgui to Import a Key Pair

- 1 Start the keytoolgui from the component to which you want to import the key pair. To do so, run the following command from the component's `<ARCSIGHT_HOME>/bin` directory.

```
./arcsight keytoolgui
```

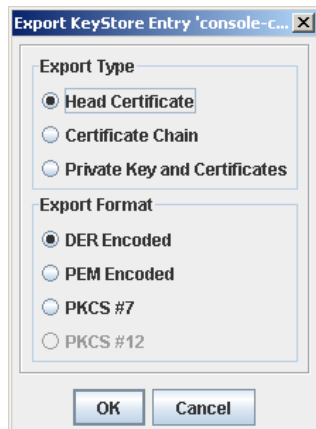

- 2 Select **File->Open KeyStore** and navigate to your component's keystore.
- 3 Enter the key store password when prompted. The default password is "changeit" without the quotes.
- 4 Select **Tools->Import Key Pair** and navigate to the location of the key pair file, select it and click **Choose**.
- 5 Enter the password for the key pair file when prompted and click **OK**.
- 6 Select the key pair and click **Import**.
- 7 Enter an alias for the key pair and click **OK**.
- 8 Enter a new password for the key pair file to be imported, re-enter it to confirm it , and click **OK**.
- 9 You will see a message saying Key Pair Import Successful. Click **OK**.
- 10 Select **File->Save Key Store** to save the changes to the keystore and exit the keytoolgui.

### Using Keytoolgui to Export a Certificate

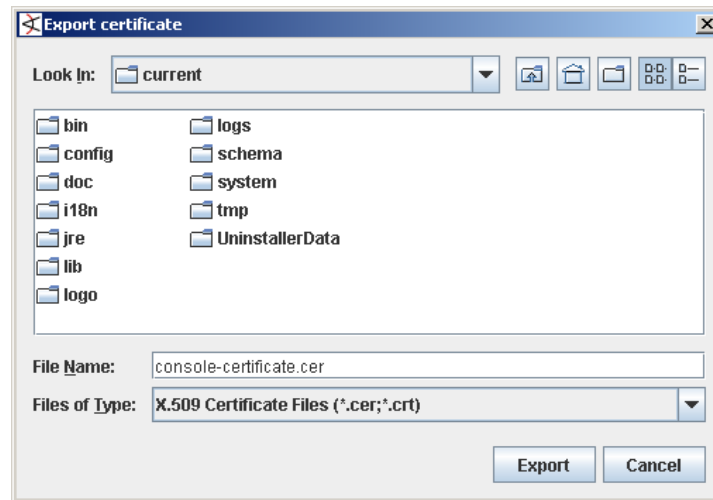

- 1 Start the keytoolgui from the component from which you want to export the certificate. To do so, run the following command from the component's `<ARCSIGHT_HOME>/bin` directory.

```
./arcsight keytoolgui
```

- 2 Select **File->Open KeyStore** and navigate to your component's truststore.
- 3 Enter the truststore password when prompted. The default password is "changeit" without the quotes.
- 4 Right-click the certificate and select **Export**.
- f Make sure to select **Head Certificate** as Export Type and **DER Encoded** as the Export Format in the following dialog and click **OK**:

- g Navigate to the location where you want to export the certificate, and enter a name for the certificate with a `.cer` extension and click **Export**.

- h You will see the following message:

- 5 If the component into which you want to import this certificate resides on a different machine than the machine from which you exported the certificate (the current machine), copy this certificate to the to the other machine.

### Using Keytoolgui to Import a Certificate

- 1 Start the keytoolgui from the component into which you want to import the certificate. To do so, run the following command from the component's `<ARCSIGHT_HOME>/bin` directory.  

```
./arcsight keytoolgui
```
- 2 Click **File->Open Keystore** and navigate to the truststore (`<ARCSIGHT_HOME>/jre/lib/security`) of the component.
- 3 Select the store named `cacerts` and click **Open**.
- 4 Enter the password for the truststore when prompted. The default password is 'changeit' (without quotes).
- 5 Click **Tools->Import Trusted Certificate** and navigate to the location of the certificate that you want to import.
- 6 Click **Import**.

- 7 You will see the following message. Click **OK**.

- 8 The Certificate details are displayed. Click **OK**.

- 9 You will see the following message. Click **Yes**.

- 10 Enter an alias for the Trusted Certificate you just imported and click **OK**.

Typically, the alias Name is same as the fully qualified host name.

- 11 You will see the following message. Click **OK**.

- 12 Save the trust store file.

### Creating a Keystore Using Keytoolgui

- 1 Start the keytoolgui from the component into which you want to import the certificate. To do so, run the following command from the component's `<ARCSIGHT_HOME>/bin` directory.

```
./arcsight keytoolgui
```

- 2 Click **File->New KeyStore**.
- 3 Select **JKS** and click **OK**.

- 4 Click **File->Save KeyStore**.

### Generating a Key Pair Using Keytoolgui

- 1 Start the keytoolgui from the component into which you want to import the certificate. To do so, run the following command from the component's `<ARCSIGHT_HOME>/bin` directory.

```
./arcsight keytoolgui
```

- 2 Click **File->Open KeyStore** and navigate to your keystore.
- 3 Click **Tools->Generate Key Pair** and fill in the fields in the General Certificate dialog and click **OK**.
- 4 Enter an alias for the newly created key pair and click **OK**.
- 5 Save the keystore by clicking **File->Save Key Store**.

## keytool

The `keytool` utility is the command-line version of `keytoolgui` that you can use to manipulate the key stores and trust stores directly. To use `keytool`, enter this command:

```
arcsight keytool -store store
```

where store can be `managercerts`, `managerkeys`, `clientcerts`, `clientkeys`, `webcerts`, `webkeys`, `ldapcerts`, or `ldapkeys`.

On SmartConnector hosts, use:

```
arcsight agent keytool -store store
```

To see options available for each store, enter:

```
arcsight keytool -store store
```

There are a few restrictions on the contents of a key store or trust store including that the Manager's certificate should have the alias `mykey`.

## tempca

The `tempca` utility enables you to manage the SSL certificate in many ways. To see a complete list of parameters available for this utility, enter this in `<ARCSIGHT_HOME>/bin`:

```
./arcsight tempca
```

On SmartConnectors, use:

```
./arcsight agent tempca
```

A few frequently performed operations using this utility are:

- Viewing the type of certificate in use on the Manager:
 

```
./arcsight tempca -i
```
- Removing the Demo certificate from the list of trusted certificates:
 

```
./arcsight tempca -rc
```

## How SSL Works

When a client initiates communication with the SSL server, the server sends its certificate to authenticate itself to the client. The client validates the certificate by verifying:

- The hostname is identical to the one with which the client initiated communication.
- The certificate issuer is in the list of trusted certificate authorities in the client's trust store (`<ARCSIGHT_HOME>/jre/lib/security/cacerts`) and the client is able to verify the signature on the certificate by using the CA's public key from the certificate in its trust store.
- The current time on the client machine is within the validity range specified in the certificate to ensure that the certificate is valid.

If the certificate is validated, the client generates a random session key, encrypts it using the server's public key, and sends it to the server. The server decrypts the session key using its private key. This session key is used to encrypt and decrypt data exchanged between the server and the client from this point forward.

The next figure illustrates the handshake that occurs between the client and Manager.

**Figure 2-1** SSL handshake between an SSL server and client

If client-side authentication is used, the server requests the client's certificate when it sends its certificate to the client. The client sends its certificate along with the encrypted session key.

## SSL certificates

To replace an expired certificate, you have to delete the old expired certificate from the truststore, cacerts, first and then import the new certificate into cacerts. Since the common name (CN) for the new certificate will be identical to the CN in the old certificate, you are not permitted have both the expired as well as the new certificate co-exist in the cacerts.

To delete a certificate from the truststore, start the keytoolgui and navigate to the certificate, right-click on the certificate and select **Delete**.

Use the keytoolgui to import the new certificate into the truststore or cacerts.

### Types

You can use three types of SSL certificates:

- CA-signed
- Self-signed (applicable to default mode only)
- Demo (applicable to default mode only)

CA-signed certificates are issued by a third party you trust. The third party may be a commercial Certificate Authority (CA) such as VeriSign and Thawte or you might have designated your own CA. Because you trust this third party, your clients' trust stores might already be configured to accept its certificate. Therefore, you may not have to do any configuration on the client side. The process to obtain a CA-signed certificate is described in ["Obtaining a CA-signed certificate" on page 47](#).

You can create your own self-signed certificates. A self-signed certificate is signed using the private key from the certificate itself. You will need to configure clients to trust each self-signed certificate you create.

ArcSight includes a built-in "demo" Certificate Authority that can issue a temporary demo certificate during the Manager installation. This CA is provided only to enable you to complete installation in the absence of a signed certificate. However, ArcSight does not recommend using a certificate issued by this CA in production environments. If your Manager was installed with a Demo certificate, you will need to configure your clients to accept this certificate.

### Comparing Self-signed and CA-signed certificates

Self-signed certificates are as secure as CA-signed, however, CA-signed certificates scale better as illustrated in this example:

If you have three SSL servers that use self-signed certificates, you will have to configure your clients to accept certificates from all of them (the three servers are three unique issuers). If you add a new server, you need to configure clients again. However, if these servers use a CA-signed certificate, you need to configure the clients once to accept the certificate. If the number of Managers grows in the future, you do not need to do any additional configuration on the clients.

## Using a Demo Certificate

You can use a demo certificate in default mode only.

---

To use a demo certificate:

- 1 On the Manager:
    - a Run this command in `<ARCSIGHT_HOME>/bin`:  

```
./arcsight managersetup
```
    - b In the Manager Configuration Wizard, select **Demo key pair** in the screen that prompts you to select the certificate type.
  - 2 On SmartConnectors:
    - a Run this command in `<ARCSIGHT_HOME>/bin`:  

```
runagentsetup
```
    - b In the SmartConnector Configuration Wizard, select **Yes, the ArcSight Manager is using a demo certificate**.
  - 3 On a Console:
    - a Run this command in `<ARCSIGHT_HOME>/bin`:  

```
consolesetup
```
    - b In the Console Configuration Wizard, select **Yes, the ArcSight Manager is using a demo certificate**.
  - 4 On ArcSight Web server:
    - a Run this command in `/opt/arcsight/web/bin`:  

```
webserversetup
```
    - b In the Web Configuration Wizard, select **Demo key pair** in the screen that prompts you to select the certificate type.
  - 5 On web browsers connecting to ArcSight Web, you do not need to set anything; however, the browsers display a security dialog every time they connect. To stop a browser from displaying this dialog:
    - a In `/opt/arcsight/web/bin`, run this command on the Manager machine to export the demo CA's certificate:  

```
arcsight tempca -dc
```

A file named `demo.crt` is created in your current working directory.
    - b Import the `demo.crt` file into your web browser.
- See your Web browser's documentation for details.

## Using a Self-Signed Certificate

The procedure you follow depends on the number of ArcSight Managers with which your clients communicate.

### When clients communicate with one ArcSight Manager

To use a self-signed certificate for deployments in which clients communicate with only one ArcSight Manager, perform these steps:

- 1 On the Manager, create a self-signed key pair:

**Note**

Steps to create a self-signed key pair may be different for a new ArcSight Manager installation as the Configuration Wizard is launched automatically during the installation process.

- a In `<ARCSIGHT_HOME>/bin`, run this command:

```
./arcsight managersetup
```

- b In the Manager Configuration Wizard, select **Replace with new Self-Signed key pair**, and click **Next**.

- c Enter information about the SSL certificate, as shown in this example. Click **Next**.

- d Enter the SSL key store password that will be used for the certificate. Click **Next**.

Remember this password. You will need to use it to open the key store.

- e Step through the Configuration Wizard.

At the end of the Configuration Wizard, these three things happen:

- i The Manager's key store, `<ARCSIGHT_HOME>/config/jetty/keystore`, is replaced with the one created using this procedure.
- ii A `selfsigned.cer` certificate file is generated in the `<ARCSIGHT_HOME>/config/jetty` directory.
- iii The newly generated self-signed certificate is added to the Manager's trust store file, `<ARCSIGHT_HOME>/jre/lib/security/cacerts`.

The self-signed certificate does not take effect until the Manager is restarted later in this procedure.

This step overwrites your existing cacerts with the new one that contains the information about the Trusted Certificate Authority (CA) that signed your self-signed certificate. However, the new cacerts file does not take effect until the client is restarted later in this procedure.

- 2 Export the Manager's certificate from `<ARCSIGHT_HOME>/jre/lib/security/cacerts`.
- 3 Make sure to copy the Manager's certificate on the machine on which the clients connecting to the Manager are/will be installed.
- 4 Import the Manager's certificate to the `<ARCSIGHT_HOME>/jre/lib/security` directory on all clients. See "Using Keytoolgui to Import a Certificate" on page 37.

Make sure you have imported the Manager's certificate to all existing clients before proceeding further. Otherwise, after you perform the next steps, only clients with the new Manager's certificate will be able to connect to the Manager.

- 5 Restart the Manager process so that the Manager can start using the self-signed certificate. Run the following command to do so:
 

```
/sbin/service arcsight_services restart manager
```
- 6 Restart all clients.
- 7 When installing a new client, repeat Steps 2-4 of this procedure.
- 8 On the ArcSight Web server, perform the steps listed in section "Setting up SSL Client Authentication on ArcSight Web" on page 60.
- 9 On the ArcSight Console, perform the steps listed in section "Setting up SSL Client-Side Authentication on ArcSight Console running in Default Mode" on page 52.

## When clients communicate with multiple ArcSight Managers

To use self-signed certificate for a deployment in which clients communicate with more than one ArcSight Managers, perform these steps for each Manager:

By following this procedure you append the self-signed certificate to the existing client trust store, cacerts. Doing so prevents overwriting cacerts, which happens if you follow the previous procedure.

- 1 Follow Step 1 from the previous procedure on all Managers.
- 2 Copy the selfsigned.cer file from all Managers to the `<ARCSIGHT_HOME>/jre/lib/security` directory on one of your clients.
 

To prevent a certificate file from overwriting another when you copy multiple certificate files with the same name to the same location, rename each certificate file as you copy. For example, copy the certificate file from ManagerA and rename it to `SelfSigned_MgrA.cer`.
- 3 On that client, use the `keytoolgui` utility to import certificates into the trust store (cacerts):
  - a In `<ARCSIGHT_HOME>/bin`, run this command:
 

```
./arcsight keytoolgui
```

- b** Click **File->Open Keystore**.
- c** In `<ARCSIGHT_HOME>/jre/lib/security`, select the store named `cacerts`. Use the password 'changeit' (without quotes) to open `cacerts`.
- d** Click **Tools->Import Trusted Certificate**:
  - i** Select the self-signed certificate for a Manager and click **Import**.
  - ii** You will see the following message. Click **OK**.

The Certificate details are displayed. Click **OK**.

- iii** You will see the following message. Click **OK**.

- iv** Enter an alias for the Trusted Certificate you just imported and click **OK**.  
Typically, the alias Name is same as the fully qualified host name.

- v** You will see the following message. Click **OK**.

- vi** Save the trust store file.
- vii** Repeat Steps i through vi for all self-signed certificates you copied.

- e On the client, enter this command in `<ARCSIGHT_HOME>/bin` to stop the client from using the currently in-use Demo certificate:

```
./arcsight tempca -rc
```

For SmartConnectors, run:

```
./arcsight agent tempca -rc
```

- 4 Copy the `<ARCSIGHT_HOME>/jre/lib/security/cacerts` file from the client in the previous step to all other clients.
- 5 Restart the Manager service so that the Manager can start using the self-signed certificate.
- 6 Restart the client.
- 7 When installing a new client, copy the cacerts file from any client you updated earlier in this procedure.

## Using a CA-Signed Certificate

Obtaining and deploying a CA-signed certificate involves these steps:

- 1 Obtaining a CA-signed certificate.
- 2 Replacing your demo or self-signed certificate with the CA-signed certificate.

**Note**

You should obtain two CA-signed certificates—one for the Manager and the other for ArcSight Web, unless both components are installed on the same machine. Follow the procedure described in this section to obtain and import the certificates to the Manager, and if appropriate, to ArcSight Web.

## Obtaining a CA-signed certificate

To obtain your own CA-signed SSL certificate for ArcSight Manager and ArcSight Web, perform these steps:

- 1 Create a key pair:
  - a On the Manager machine, run this command to launch the `keytoolgui` utility in `<ARCSIGHT_HOME>/bin`:
 

```
./arcsight keytoolgui
```
  - b Click **File->New KeyStore** to create a new key store.  
Make sure to select JKS:
    - JKS (ArcSight default)
    - PKCS #12
  - c To create the key pair, click **Tools->Generate Key Pair**.  
Generating the key pair can take some time.

- d Enter information about the new key pair, including the length of time for its validity (in days). Click **OK**.

Note

For Common Name (CN), enter the fully qualified domain name of the Manager. Ensure that DNS servers, which the clients connecting to this host will use, can resolve this host name.

Provide a valid e-mail address as the CAs typically send an e-mail to this address to renew the certificate.

- e Specify an alias called 'mykey' (a name for referring to the new key pair in the future).

Note

The default alias is the Common Name (CN) you provided in the previous step.

- f Click **File->Save** to save the key store.

Save the key store with a name such as `keystore.request`.

If saving the key store on ArcSight Web, save the file with a name such as `webkeystore.request`.

Use the password of your existing key store to save this key store. If you do not remember the password, run the Manager Configuration Wizard and change the password of your existing key store first.

- 2 Create a certificate signing request (CSR):

- a In the `keytoolgui` utility, right-click the new key pair you created (mykey) and select **Generate CSR** to create a Certificate Signing Request.

- b Choose a path and filename, and click **Generate**.

The default file name is `certreq.csr`.

A CSR file is generated in the current working directory.

- 3 Send the CSR to the selected Certificate Authority (CA).

After verifying the information you send, the CA electronically signs the certificate using its private key and replies with a certification response that contains the signed certificate.

## Importing a CA-signed certificate into Manager's truststore

When the CA has processed your request, it sends you a file with the signed certificate.

The SSL certificate you receive from the Certificate Authority must be a 128-bit X.509 Version 3 certificate. The type of certificate is the same one that is used for common web servers. The signed certificate must be returned by the CA in base64 encoded format. It will look similar to this:

```
-----BEGIN CERTIFICATE-----
MIICjTCCAfaGAwIBAgIDWnWvMA0GCSqGSIb3DQEBAUAMIGHMQswCQYDVQQGEwJaQT
EiMCAGA1UECBMZK9SIFRFU1RJTkcGUUVSUE9TRVMGT05MWTEdMBsGA1UEChMUUVGhh

-----END CERTIFICATE-----
```

This file must be imported into the key store.

Before proceeding with the following procedure, make sure the name of the issuer that signed your certificate exists as a Trusted CA in cacerts. (Use [keytoolgui](#) to check your cacerts.) If the issuer's root certificate does not exist, import the root certificate of the CA in the cacerts trust store before importing the signed SSL certificate in your Manager's trust store. If the certificate is a chain, you must also import all intermediate certificates.

Follow these steps to import the signed certificate:

- 1 Copy the signed certificate on the Manager in the `<ARCSIGHT_HOME>/config/jetty` directory.
- 2 On the Manager machine, run this command in `<ARCSIGHT_HOME>/bin`:  

```
./arcsight keytoolgui
```
- 3 Click **File->Open Keystore** and select the key store (**keystore.request** or **webkeystore.request**) you saved in [Step f](#) in "Obtaining a CA-signed certificate" on [page 47](#). You will need to provide the password you used to save the key store in that step.
- 4 Right-click the key pair you created at the beginning of the process and named mykey.
- 5 Select **Import CA Reply** from the menu.

- 6 Select the CA reply certificate file and click **Import**.

If the CA reply file contains a chain of certificates, the `keytoolgui` utility tries to match the reply's root CA to an existing Trusted Certificate in your cacerts trust store. If this operation fails, the Certificate Details dialog appears for manual verification. Acknowledge the certificate by clicking **OK** and answering **Yes** to the subsequent challenge. Answer **No** if the certificate is not trustworthy for some reason.

After the key pair you generated has been updated to reflect the content of the CA reply, the key store named `keystore.request` contains both the private key and the signed certificate (in the alias `mykey`).

- 7 Choose **Save** from the File menu or the toolbar.

The key store is now ready for use by the ArcSight Manager or ArcSight Web.

- 8 Rename `<ARCSIGHT_HOME>/config/jetty/keystore` to `<ARCSIGHT_HOME>/config/jetty/keystore.old`.

If, for any reason, the new key store does not work properly, you can revert back to the demo key store by replacing `keystore.old` with the new keystore.

For ArcSight Web, rename the file to `webkeystore.old`.

- 9 Copy `<ARCSIGHT_HOME>/config/jetty/keystore.request` to `<ARCSIGHT_HOME>/config/jetty/keystore`.

For ArcSight Web, copy `webkeystore.request` to `webkeystore`.

- 10 If your Manager clients trust the CA that signed your server certificate, go to [Step 12](#).

Otherwise, perform these steps to update the client's cacerts (trust store):

You also need to perform these steps on the Manager to update the Manager's cacerts so that Manager clients such as the archive utility can work.

---

- a** Obtain a root certificate from the CA that signed your server certificate and copy it to your client machine.
- b** For one client, use the `keytoolgui` utility to import the certificate into the trust store (cacerts):

**i** In `<ARCSIGHT_HOME>/bin`, run this command:

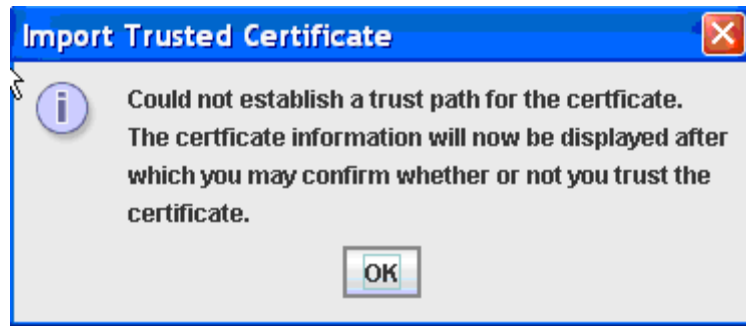

```
./arcsight keytoolgui
```

**ii** Click **File->Open Keystore**.

**iii** Select the store named cacerts. Use the password `changeit` to open cacerts.

**iv** Click **Tools->Import Trusted Certificate** and select the certificate you copied in Step 10a of this procedure.

- v You will see the following message. Click **OK**.

- vi Enter an alias for the Trusted Certificate you just imported and click **OK**.

- vii Right-click the alias **ca** in the trust store and choose **Delete** from the menu.
  - viii Save the key store.
- c Copy the `<ARCSIGHT_HOME>/jre/lib/security/cacerts` file from the client in the previous step to all other clients.
- 11** If your ArcSight Web browser clients trust the CA that signed your ArcSight Web certificate, go to [Step 12](#).
- Otherwise, perform these steps:
- a Obtain a root certificate from the CA that signed your ArcSight Web certificate.
  - b Import the certificate into your web browser. See your browser's documentation for details.
- 12** Restart the Manager process.

**Note**

Clients will lose connectivity to the Manager after you restart it. However, you will be able to reconnect the clients after you perform the next step.

- 13** Restart all clients.
- 14** To verify that the new certificate is being used, point a web browser that trusts the CA, which signed the certificate, to ArcSight Web or connect to the Manager using your Console.

## Replacing an Expired Certificate

When a certificate in your truststore/cacerts expires, you need to replace it with a new one. To replace the certificate:

- 1** Delete the expired certificate from the truststore/cacerts.

To delete a certificate from the truststore or cacerts, start the keytoolgui and navigate to the certificate, right-click on the certificate, and select **Delete**.

- 2 Replace the certificate by importing the new certificate into truststore/cacerts as the case may be. Use the keytoolgui to import the new certificate into the truststore or cacerts. See [“Using a Demo Certificate” on page 42](#), [“Using a Self-Signed Certificate” on page 43](#), or [“Using a CA-Signed Certificate” on page 47](#) section (depending on the type of certificate you are importing) for steps on how to import the certificate.

Since the common name (CN) for the new certificate is identical to the CN in the old certificate, you are not permitted to have both the expired as well as the new certificate co-exist in the truststore, cacerts.

## Establishing SSL Client Authentication

By default, clients (SmartConnectors, Consoles, and ArcSight Web) authenticate using user name and password. The clients can optionally use SSL authentication for clients. If SSL client authentication is enabled, you can optionally disable user name and password login, as described in the next section.

When client-side authentication is used, the SSL clients contain a key store and the SSL server contains a trust store.

**Note**

Before you enable client-side authentication, make sure that you log in to the Console and create a new user or modify an existing user such that you set the user's `external_id` to the one specified in the certificate created on the Console. The external id should be set to the users name set as the CN (Common Name) setting when creating the certificate.

## Setting up SSL Client-Side Authentication on ArcSight Console running in Default Mode

If you want to enable client-side authentication for ArcSight Console running in default mode, perform these steps in addition to the ones you perform for setting up server authentication:

- 1 On each Console, generate a key pair. For CA-signed certificate follow the steps in section [“Obtaining a CA-signed certificate” on page 47](#).:
  - a From the Console's `<ARCSIGHT_HOME>/bin` directory start the keytoolgui by running the following command:
 

```
./arcsight keytoolgui
```
  - b Open **File->New Keystore**. This will open the New Keystore Type dialog.
  - c Select **JKS** and click **OK**.

- d Click **Tools->Generate Key Pair** and fill in the fields in the following dialog:

Note

The Common Name field in the following screen should be the external ID of the user that will be logging in to the Manager that this console will be connecting to.

- e Enter an alias for the key pair in the following dialog and click **OK**:

Caution

If you plan to install the Console, Manager, and Web on the same machine, make sure that this alias is unique. Also, make sure not to use the machine name or IP address for the alias. ArcSight Web and Console cannot have identical CNs when installed on the same machine as the Manager.

When you install ArcSight Web, you will be required to set the CN of the ArcSight Web's key pair you generate to the name or IP address of the machine on which you are installing it. Hence, if both Web and Console are on the same machine, and if you use the machine name or IP address for the CN for both the Web and the Console, then ArcSight Web will give you an error when configuring.

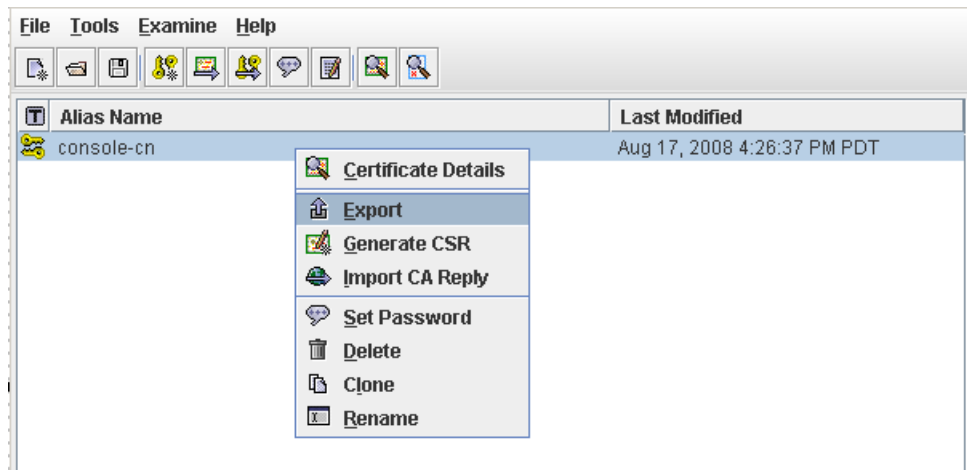

- f Enter a password for the keystore and confirm it and click **OK**.

- g You will see the following message.

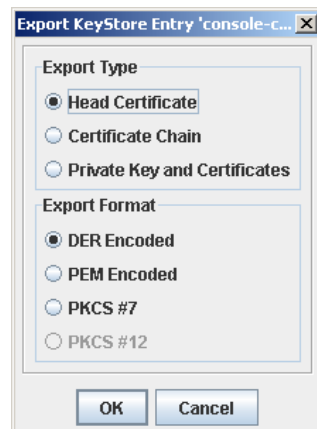

- 2 Export the key pair you just generated.

- a In the keytoolgui right-click the key pair you just generated and select **Export**.

- b Make sure to select **Head Certificate** as Export Type and **DER Encoded** as the Export Format in the following dialog and click **OK**:

- c Enter a name for the certificate and click **Export**.

- d You will see the following message:

- e If your Console is on a different machine than the Manager, copy this certificate to the Manager's machine.

**3** If you are using self-signed certificate skip this step and continue with step 4.

Import the signed certificate response in the keystore of all Consoles.

- ◆ Import the signed certificate response in the Console's keystore, `keystore.client`. Follow the steps in section ["Importing a CA-signed certificate into Manager's truststore" on page 49](#).
- ◆ Use the `changepassword` tool to set an encrypted key store password in the `client.properties` file:

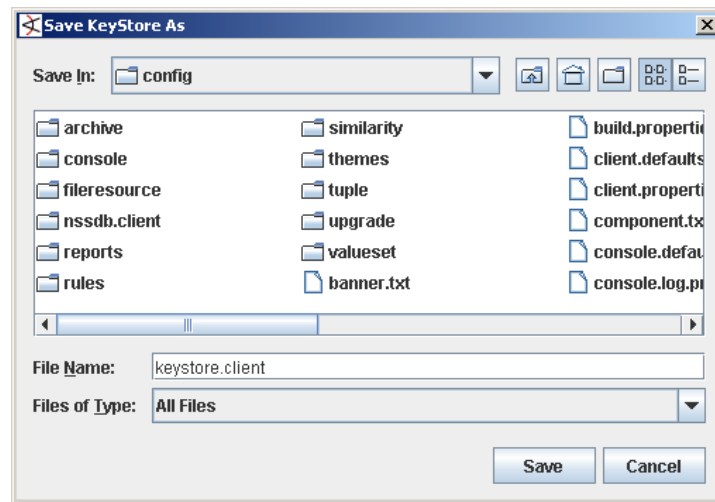

```
arcsight changepassword -f config/client.properties -p
ssl.keystore.password
```

**4** Save the keystore in the Console's `<ARCSIGHT_HOME>/config` directory by clicking on **File->Save KeyStore**.

- a Enter a password for the keystore and confirm it.

- b** Enter `keystore.client` (name for the keystore) in the File Name text box and click **Save**.

- 5** Change the following properties in the Console's `<ARCSIGHT_HOME>/config/client.properties` file and save the file:

```
ssl.keystore.password=<set-this-to-password-set-when-you-saved-
the-keystore>
```

```
ssl.keystore.path=config/keystore.client
```

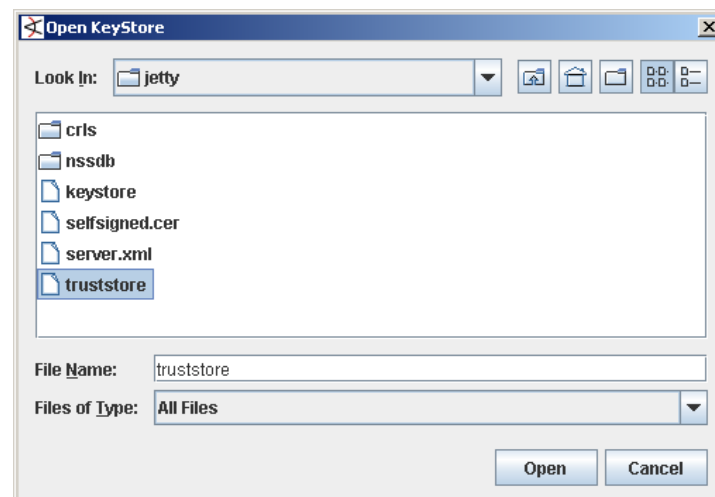

```
ssl.client.auth=true
```

Make sure that you do not change the keystore name to anything other than `keystore.client`.

- 6** Import Console's certificate into the Manager's truststore.

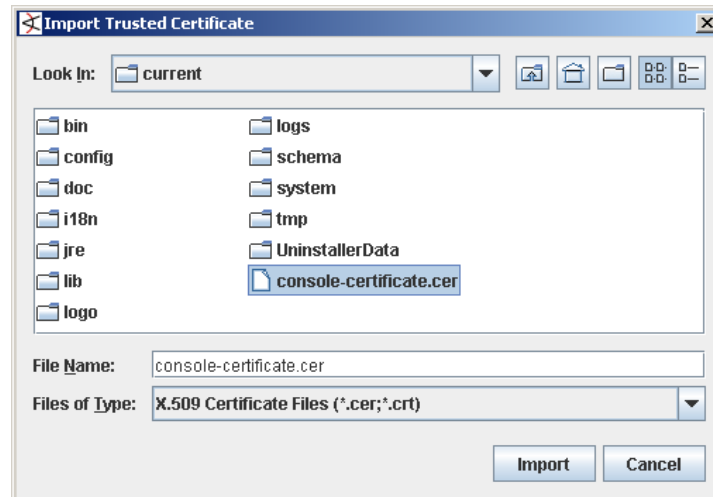

If your Manager trusts the CA that signed your Console's certificates, go to the next step. Otherwise perform these steps to update the Manager's truststore.

- a** Start the keytoolgui by entering `arcsight keytoolgui` command from the Manager's bin directory.
- b** Click **File->Open KeyStore** and navigate to Manager's `<ARCSIGHT_HOME>/config/jetty/truststore`.

- c Enter "changeit" (without the quotes) when prompted for the password and click **OK**.
- d Click **Tools->Import Trusted Certificate**.
- e Navigate to the Console's certificate that you exported earlier and click **Import**.

- f You will see the following message. Click **OK**.

- g Review the certificate details and click **OK**.
- h Click **Yes** in the following dialog.

- i Enter an alias for the certificate.

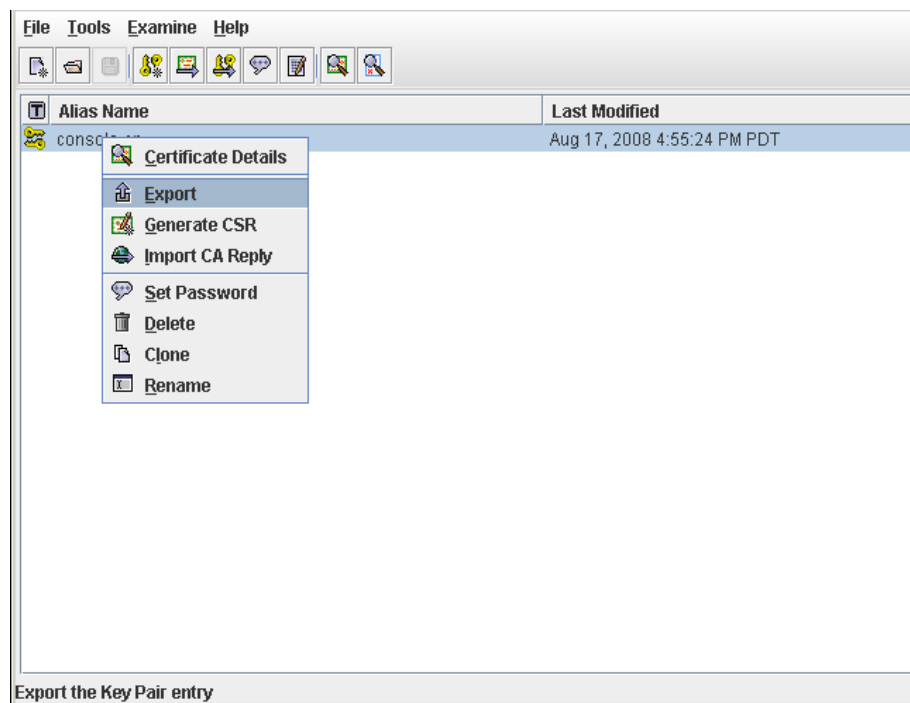

- j You will get the following message if the import was successful.

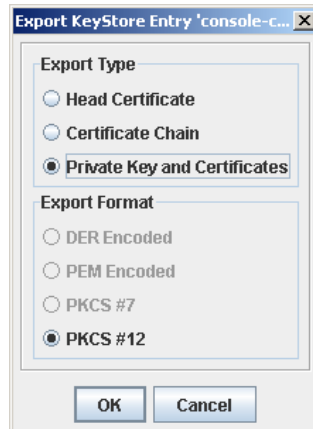

- k** Click **OK** and save the changes to the truststore.
- 7** Export the Console's private key. If you use ArcSight Web, you are required to import the Console's private key into the Web browser you use with ArcSight Web.
  - a** Start the keytoolgui from the Console's [bin](#) directory.
  - b** Click on **File->Open KeyStore** and navigate to the Console key store you created.

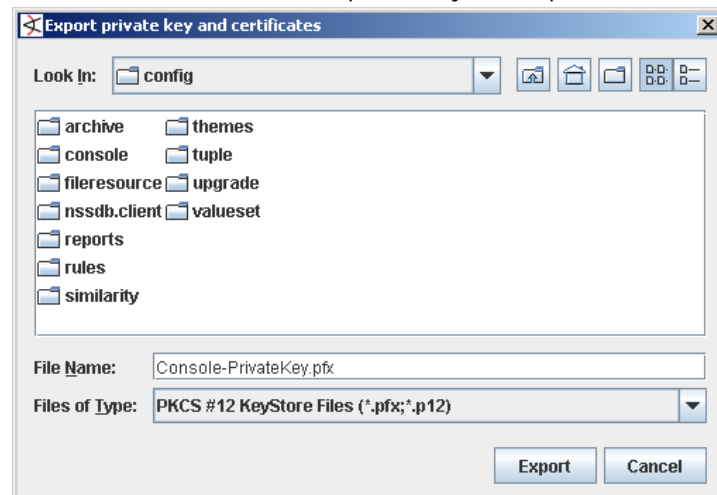

- c** Right-click on the Console's key pair and select Export.

- d Select **Private Key and Certificates** as Export Type and **PKCS#12** as the Export Format if not already selected and click **OK**.

- e Enter the password that you had set for the Console's keystore when prompted and click **OK**.
- f Enter a new password for the keystore and confirm the password and click **OK**.
- g Enter a name for the Console's private key with a .pfx extension and click **Export**.

- h You will receive a message saying Export Successful. Click **OK** and exit the keytoolgui.

- 8 Exit keytoolgui.
- 9 Restart the Manager.
- 10 Restart ArcSight Console.

## Setting up SSL Client Authentication on ArcSight Web

If you want to enable client-side authentication for clients running in default mode, perform these steps in addition to the ones you perform for setting up server authentication:

- 1 Generate a key pair on ArcSight Web. For CA-signed certificate follow the steps in section [“Obtaining a CA-signed certificate” on page 47](#)

- a From the Web's `<ARCSIGHT_HOME>/bin` directory start the keytoolgui by running the following command:

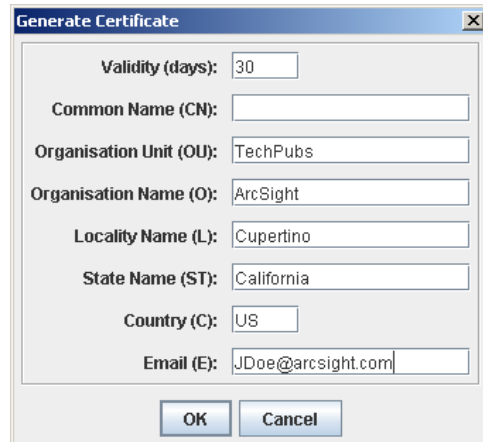

```
./arcsight keytoolgui
```

- b Open **File->New Keystore**. This will open the New Keystore Type dialog.

- c Select **JKS** and click **OK**.

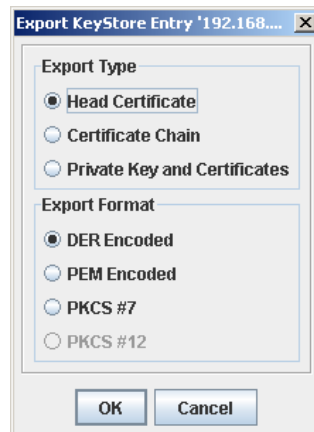

- d Click **Tools->Generate Key Pair** and fill in the fields in the following dialog:

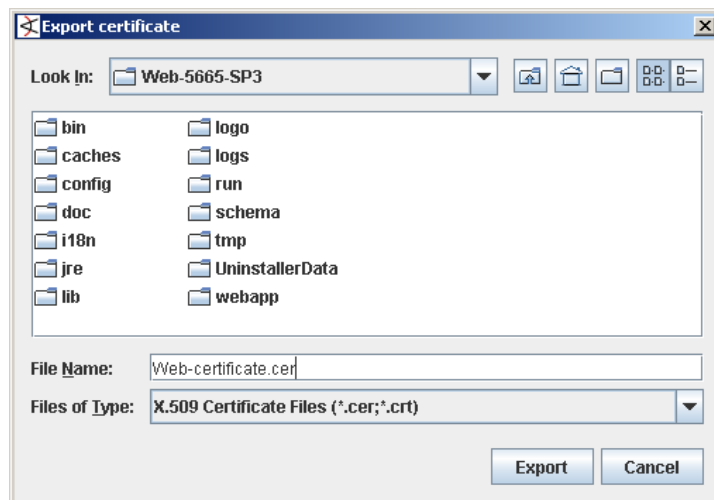

Make sure to use the machine name or IP address on which ArcSight Web is installed for the CN name.

- e Enter an alias for the key pair and click **OK**.
- 2 Export the key pair you just generated.
    - a In the keytoolgui right-click the key pair you just generated and select **Export Key pair**.

- b** Make sure to select **Head Certificate** as Export Type and **DER Encoded** as the Export Format in the following dialog and click **OK**:

- c** Enter a name for the certificate and click Export.

- d** You will see the following message:

- e** If your ArcSight Web is on a different machine than the Manager, copy this certificate to the Manager's machine.
- 3** Save the keystore in the Web's `<ARCSIGHT_HOME>/config` directory by clicking on **File->Save KeyStore**.
- a** Enter a password for the keystore and confirm it.

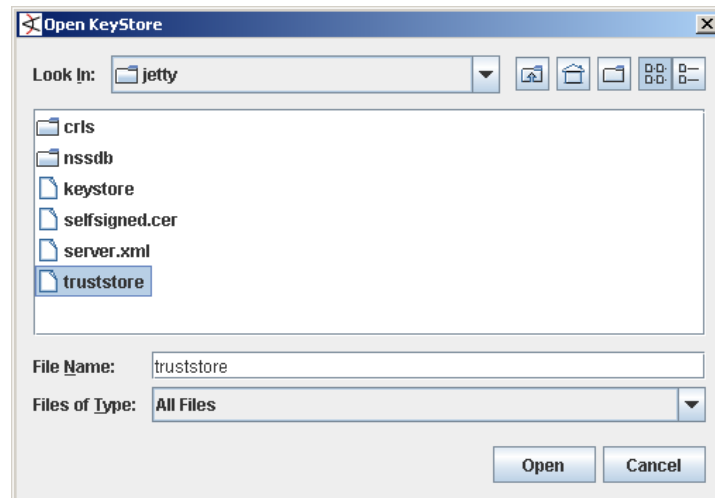

- b** Give the keystore a name and click **Save**.
- 4** If you are using self-signed certificate skip this step and continue with step 5.  
Import the signed certificate response in the keystore of ArcSight Web.
  - ◆ Import the signed certificate response in the Web's keystore. Follow the steps in section ["Importing a CA-signed certificate into Manager's truststore" on page 49](#).
  - ◆ Use the `changepassword` tool to set an encrypted key store password in the `client.properties` file:
 

```
arcsight changepassword -f config/client.properties -p
ssl.keystore.password
```
- 5** Add the following properties in the Web's `<ARCSIGHT_HOME>/config/client.properties` file and save the file:
 

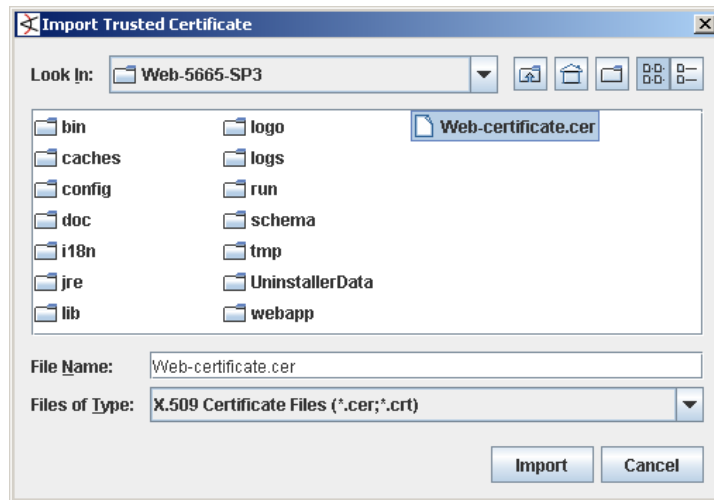

```
ssl.keystore.password=<password-set-when-you-saved-the-keystore>

ssl.keystore.path=config/jetty/webkeystore
```
- 6** Import Web's key pair into the Manager's truststore.  
If your Manager trusts the CA that signed your client's certificates, go to the next step. Otherwise perform these steps to update the Manager's truststore.
  - a** Start the `keytoolgui` by entering `arcsight keytoolgui` command from the Manager's bin directory.
  - b** Click **File->Open KeyStore** and navigate to `<ARCSIGHT_HOME>/config/jetty/truststore`.

- c** Enter "changeit" (without the quotes) when prompted for the password and click **OK**.
  - d** Click **Tools->Import Trusted Certificate**.

- e Navigate to the Web's certificate that you exported earlier and click **Import**.

- f You will see the following message. Click **OK**.

- g Review the certificate details and click **OK**.

- h Click **Yes** in the following dialog.

- i Enter an alias for the certificate.

- j You will get the following message if the import was successful.

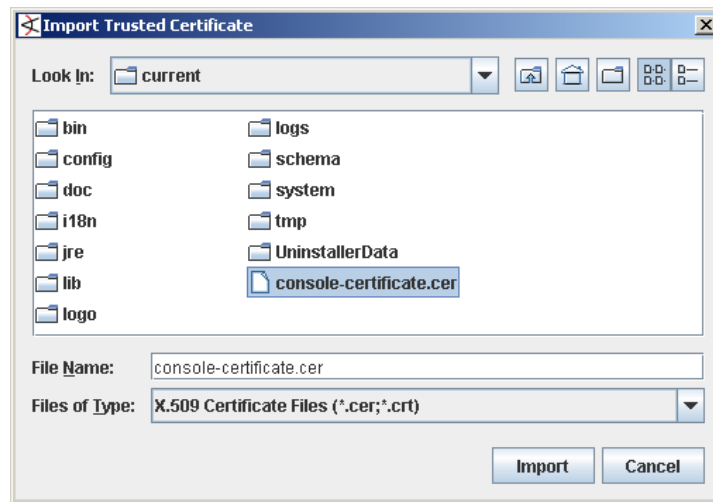

- k Click **OK** and save the changes to the truststore.

**7** Import Console's certificate into webtruststore.

- a Start the keytoolgui from ArcSight Web's `bin` directory.
- b Click **File->Open KeyStore** and navigate to the Web's `<ARCSIGHT_HOME>/config/jetty/webtruststore`.
- c Enter "changeit" (without quotes) when prompted for password.

- d Click **Tools->Import Trusted Certificate**.

- e Navigate to the Console's certificate and click **Import**.
- f Click **OK** in the next message box prompting you that "Could not establish a trust path for the certificate..."
- g View the certificate details and click **OK**.
- h Click **Yes** when prompted whether you want to accept the certificate as trusted.
- i Enter an alias for the console's certificate and click **OK**.
- j You will see a message saying "Trusted Certificate Import Successful."
- k Click **OK**.
- l Save changes to the webtruststore and exit the keytoolgui.
- 8 Import the following into the web browser that you will be using with ArcSight Web:
- ◆ Web's certificate you exported in [Step 2 on page 60](#) above.
  - ◆ Console's private key you created in [Step 7 on page 58](#) in section "Setting up SSL Client-Side Authentication on ArcSight Console running in Default Mode" on [page 52](#).
- See your web browser's documentation for steps to do the above.
- 9 Restart the Manager.
- 10 Restart ArcSight Web.

## Setting up Client-side Authentication on SmartConnectors

In order to enable client-side authentication on clients (SmartConnectors) running in default mode, perform these steps:

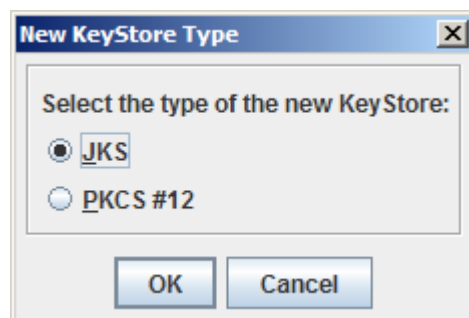

- 1 Create a new client keystore in the SmartConnector's `/config` directory.
- a Start the keytoolgui from the client's `bin` directory by running the following:
- On SmartConnector:
- ```
./arcsight agent keytoolgui
```

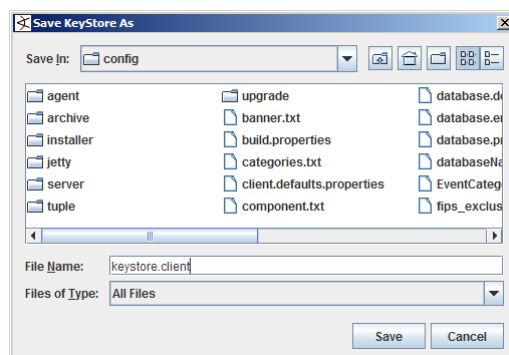

- b Go to **File->New KeyStore**.

- c Select **JKS** for type of keystore and click **OK**.

- d Save the keystore by clicking **File->Save KeyStore As**, navigate to the `config` directory, enter `keystore.client` in the File Name box and click **Save**.

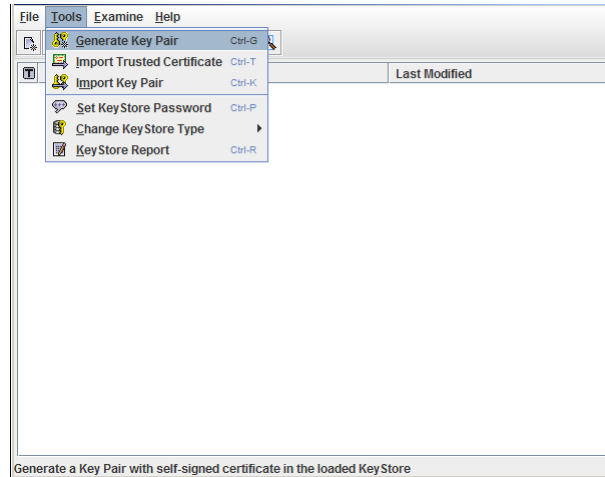

- e Set a password for the keystore and click **OK**.

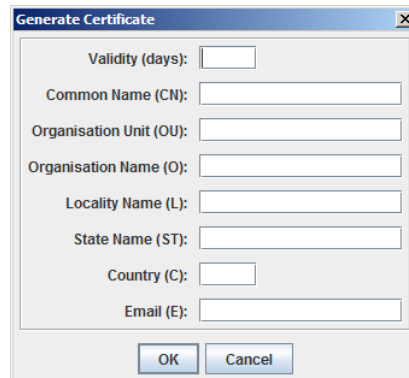

- 2 Create a new keypair in the `config/keystore.client` of the SmartConnector. (If you already have a keypair that you would like to use, you can import the existing keypair into the client's `config/keystore.client`. See section “Using Keytoolgui to Import a Key Pair” on page 36 for details.)

- a In keytoolgui, click **Tools->Generate Key Pair**.

- b In the Generate Certificate dialog enter the details requested and click **OK**.

- c Enter an alias for the key pair and click **OK**.

- d Set a password for the key pair and click **OK**.

- e You will see the following message after the key pair is created. Click **OK**.

You should now see a key pair with the alias you set for it in the keystore.

- 3 Create a client SSL configuration text file in the `config` directory and name it `client.properties`. The contents of `config/client.properties` file should be as follows:

```
auth.null=true

ssl.client.auth=true

cac.login.on=false

ssl.keystore.path=config/arcsightkeystore.client

ssl.keystore.password=<client.keystore_password>
```

Make sure that this password is identical to the password that you set for `/config/keystore.client` when creating it.

Note

- 4 Export the client's (Connector) certificate using keytoolgui. See section ["Using Keytoolgui to Export a Certificate" on page 36](#) for details.
- 5 Import the CA's certificate of the client's certificate (in case you are using CA-signed certificate) or the client's certificate itself (in case you are using a self-signed certificate) into the Manager's truststore, `/config/jetty/truststore`. see section ["Using Keytoolgui to Import a Certificate" on page 37](#) for details.
- 6 Restart the Manager.
- 7 Restart the client (Connector).

## Migrating from one certificate type to another

When you migrate from one certificate type to another on the Manager, you have to update all Consoles, SmartConnectors, and ArcSight Web installations.

### Migrating from Demo to Self-Signed

To migrate from a demo to self-signed certificate:

- 1 Follow the steps described in ["Using a Self-Signed Certificate" on page 43](#).
- 2 Follow the instructions in ["Verifying SSL Certificate Use" on page 68](#) to ensure that a self-signed certificate is in use.

### Migrating from Demo to CA-Signed

To migrate from a demo to CA-Signed certificate:

- 1 Follow the steps described in ["Using a CA-Signed Certificate" on page 47](#).

- 2 Follow the instructions in [“Verifying SSL Certificate Use” on page 68](#) to ensure that CA-signed certificate is in use.

## Migrating from Self-Signed to CA-Signed

To migrate from a self-signed to CA-signed certificate:

- 1 Follow the steps described in [“Using a CA-Signed Certificate” on page 47](#).
- 2 Follow the instructions in [“Verifying SSL Certificate Use” on page 68](#) to ensure that a CA-signed certificate is in use.

## Verifying SSL Certificate Use

After the migration, run this command in `<ARCSIGHT_HOME>/bin` on the client to ensure the certificate type you intended is in use:

```
./arcsight tempca -i
```

In the resulting output, a sample of which is available below, do the following:

- 1 Review the value of the line: `Demo CA trusted`.

The value should be “no.”

If the value is “yes,” the demo certificate is still in use. Follow these steps to stop using the demo certificate:

- a In `<ARCSIGHT_HOME>/bin`, enter the following command to make the client stop using the currently in use demo certificate:

```
./arcsight tempca -rc
```

For SmartConnectors, run:

```
./arcsight agent tempca -rc
```

- b Restart the client.

- 2 Verify that the Certificate Authority that signed your certificate is listed in the output.

For a self-signed certificate, the Trusted CA will be the name of the machine on which you created the certificate

## Sample output for verifying SSL certificate use

This is a sample output of the `arcsight tempca -i` command run from a Console's `bin` directory on the Windows platform:

```
ArcSight TempCA starting...
```

```
SSL Client
```

```
Trust Store C:\arcsight\Console\current\jre\lib\security\cacerts
```

```
    Type                                JKS
```

```
    Demo CA trusted                     no
```

```
    Trusted CA                          DigiCert Assured ID Root CA  
[digiCertAssuredIDRootCA]
```

```

Trusted CA          TC TrustCenter Class 2 CA II
[trustcenterclass2caii] .

.

.

Demo CA

Key Store C:\arcsight\Console\current\config\keystore.tempca

Exiting...

```

## Using Certificates to Authenticate Users to ArcSight

Instead of using a user name and password to authenticate a user to ArcSight Manager or ArcSight Web, you can configure these systems to use a digitally-signed user certificate. This section tells you how to do that. You can use Manager's this capability in environments that make use of Public Key Infrastructure (PKI) for user authentication.

The Manager and ArcSight Web accept login calls with empty passwords and use the Subject CN (Common Name) from the user's certificate to identify the user.

Before you enable client-side authentication, make sure that you log in to the Console and create a new user or modify an existing user such that you set the user's `external_id` to the one specified in the certificate created on the Console. The external id should be set to the users name set as the CN (Common Name) setting when creating the certificate.

You must enable SSL client authentication as described in the previous section to use digitally-signed user certificates for user authentication.

To configure the Manager or ArcSight Web to use user certificates, do the following:

- 1 On the Console, make sure that External ID field in the User Editor for every user is set to a value that matches the CN in their user certificate.
- 2 Restart the system you are configuring.
- 3 Restart the Consoles.

When you start the Console, the user name and password fields will be grayed out. Simply select the Manager to which you want to connect and click **OK** to log in.

## Using the Certificate Revocation List (CRL)

ArcSight Express v3.0 supports the use of CRL to revoke a CA-signed certificate which has been invalidated. The CA that issued the certificates also issues a CRL file which contains a signed list of certificates which it had previously issued that it now considers invalid. ArcSight Manager checks the client certificates against the list of certificates listed in the CRL and denies access to clients whose certificates appear in the CRL.

Before you use the CRL feature, make sure:

- Your certificates are issued/signed by a valid Certificate Authority or an authority with an ability to revoke certificates.
- The CA's root certificate is present in the Manager's `<ARCSIGHT_HOME>/config/jetty/truststore` directory.

The Manager validates the authenticity of the client certificate using the root certificate of the signing CA.

- You have a current CRL file provided by your CA.

The CA updates the CRL file periodically as and when additional certificates get invalidated.

To use the CRL feature:

- 1 Make sure you are logged out of the Console.
- 2 Copy the CA-provided CRL file into your Manager's `<ARCSIGHT_HOME>/config/jetty/crls` directory.

After adding the CRL file, it takes approximately a minute for the Manager to get updated.

## Reconfiguring the ArcSight Console after Installation

You can reconfigure ArcSight Console at anytime by typing `arcsight consolesetup` within a command prompt window.

Run the ArcSight Console Configuration Wizard by entering the following command in a command window in the `<ARCSIGHT_HOME>/bin` directory:

```
./arcsight consolesetup
```

To run the ArcSight Console Setup program without the graphical user interface, type:

```
./arcsight consolesetup -i console
```

The ArcSight Console Configuration Wizard appears.

## Reconfiguring ArcSight Manager

To reconfigure ArcSight Manager settings made during installation, run the ArcSight Manager Configuration Wizard by typing the following command in a terminal box or command prompt window:

```
./arcsight managersetup
```

The `arcsight managersetup` command opens the ArcSight Manager Configuration Wizard, but you can also run the ArcSight Manager Setup program silently by typing:

```
./arcsight managersetup -i console
```

The ArcSight Manager Configuration Wizard appears to help you re-configure ArcSight Manager.

To change advanced configuration settings (port numbers, database settings, log location, and so on) after the initial installation, change the `server.properties` file. ArcSight's default settings are listed in the `server.defaults.properties` file. You can override these default settings by adding the applicable lines from `server.defaults.properties` to the `server.properties` file. These files are located in `<ARCSIGHT_HOME>/config`.

## Changing ArcSight Manager Ports

In order for every component of ArcSight to communicate, any ArcSight SmartConnectors and ArcSight Consoles must be aware of what IP address the ArcSight Manager is running on. Also, the ArcSight SmartConnectors and ArcSight Consoles must use the same HTTP or HTTPS port numbers the ArcSight Manager is currently using.

ArcSight Manager uses a single port (by default, 8443) that any firewalls between the ArcSight Manager, ArcSight Console, and any ArcSight SmartConnectors must allow communication through. Port 8443 is the default port used when initially installing ArcSight, however, you can change this default port number using the ArcSight Manager Configuration Wizard.

## Changing ArcSight Web Session Timeouts

The session timeout affects the web browser pages (i.e., Knowledge Base, reports, and so forth) that appear within ArcSight Web. After the session has elapsed, or timed out, you must log back into ArcSight Web to start a new session. You can change the Web default session timeout in this file in the Manager's

`<ARCSIGHT_HOME>/config/jetty/server.xml` file.

The ArcSight Web default session timeout can be changed in this file in ArcSight Web's

`<ARCSIGHT_HOME>/config/jetty/webserver.xml` file.

In the above .xml files you will see the following lines:

```
<session-config>

    <session-timeout>15</session-timeout>

</session-config>
```

The value specified, in this case 15, is the session timeout in minutes. Simply change this number to the session timeout desired and save the file.

## Manager Password Configuration

ArcSight Manager supports a rich set of functionality for managing users passwords. This section describes various password configuration options. Generally, all the settings are made by editing the `server.properties` file. See ["Managing and Changing Properties File Settings"](#) on page 13.

## Enforcing Good Password Selection

There are a number of checks that ArcSight Manager performs when a user picks a new password in order to enforce good password selection practices.

### Password Length

The simplest one is a minimum and, optionally, a maximum length of the password. The following keys in `server.properties` affect this:

```
auth.password.length.min=6
auth.password.length.max=20
```

By default, the minimum length for passwords is six characters and the maximum length is 20 characters and can contain numbers and/or letters.

Configuring the above properties to a value of `-1` sets the password length to unlimited characters.

## Restricting Passwords Containing User Name

Another mechanism that enforces good password practices is controlled through the following `server.properties` key:

```
auth.password.userid.allowed=false
```

When this key is set to false (the default), a user cannot include their user name as part of the password.

## Requiring Mix of Characters in Passwords

Good passwords consist not only of letters, but contain numbers and special characters as well. This makes them a lot harder to guess and, for the most part, prevents dictionary attacks.

By default, the minimum length for passwords is six characters and the maximum length is 20 characters and can contain numbers and/or letters.

The following properties control the distribution of characters allowed in new passwords:

```
auth.password.letters.min=-1
auth.password.letters.max=-1
auth.password.numbers.min=-1
auth.password.numbers.max=-1
auth.password.whitespace.min=0
auth.password.whitespace.max=0
auth.password.others.min=-1
auth.password.others.max=-1
```

The `*.min` settings can be used to enforce that each new password contains a minimum number of characters of the specified type. The `*.max` settings can be used to limit the number of characters of the given type that new passwords can contain. Letters are all letters from A-Z, upper and lowercase, numbers are 0-9; "whitespace" includes spaces, etc.; "others" are all other characters, including special characters such as `#$%&@!`.

Additionally, the following `server.properties` key lets you restrict the number of consecutive same characters allowed.

```
auth.password.maxconsecutive=3
```

For example, the default setting of 3 would allow "adam999", but not "adam9999" as a password.

Furthermore, the following `server.properties` key enables you to specify the length of a substring that is allowed from the old password in the new password.

```
auth.password.maxoldsubstring=-1
```

For example, if the value is set to 3 and the old password is "secret", neither "secretive" nor "cretin" is allowed as a new password.

## Checking Passwords with Regular Expressions

To accommodate more complex password format requirements, ArcSight Manager can also be set up to check all new passwords against a regular expression. The following `server.properties` keys can be used for this purpose:

```
auth.password.regex.match=
```

```
auth.password.regex.reject=
```

The `auth.password.regex.match` property describes a regular expression that all passwords have to match. If a new password does not match this expression, ArcSight Manager rejects it. The `auth.password.regex.reject` property describes a regular expression that no password may match. If a new password matches this regular expression, it is rejected.

Backslash ( \ ) characters in regular expressions must be duplicated (escaped)—instead of specifying \, type \\.

For more information on creating an expression for this property, see <http://www.regular-expressions.info/>. The following are a few examples of regular expressions and a description of what they mean.

■ `auth.password.regex.match= /^[^0-9].*[^0-9]$/`

Only passwords that do not start or end with a digit are accepted.

■ `auth.password.regex.match= ^(?=[A-Z].*[A-Z])(?=[a-z].*[a-z])(?=[0-9].*[0-9])(?=[^a-zA-Z0-9].*[^a-zA-Z0-9]).{10,}$`

Only passwords that contain at least 10 characters with the following breakdown are accepted:

- ◆ At least two upper case letters
- ◆ At least two lower case letters
- ◆ At least two digits
- ◆ At least two special characters (no digits or letters)

■ `auth.password.regex.reject= ^(?=[A-Z].*[A-Z])(?=[a-z].*[a-z])(?=[0-9].*[0-9])(?=[^a-zA-Z0-9].*[^a-zA-Z0-9]).{12,}$`

The passwords that contain 12 characters with the following breakdown are rejected:

- ◆ At least two upper case letters
- ◆ At least two lower case letters
- ◆ At least two digits
- ◆ At least two special characters (no digits or letters)

## Password Uniqueness

In some environments, it is also desirable that no two users use the same password. To enable a check that ensures this, the following `server.properties` key can be used:

```
auth.password.unique=false
```

If set to true, ArcSight Manager checks all other user's passwords and makes sure nobody else is using the same password.

---

This feature may not be appropriate for some environments as it allows valid users of the system to guess other user's passwords.

---

## Setting Password Expiration

ArcSight Manager can be set up to expire passwords after a certain number of days, forcing users to choose new passwords regularly. This option is controlled by the following key in `server.properties`:

```
auth.password.age=60
```

By default, a password expires 60 days from the day it is set.

When this setting is used, however, some problems arise for user accounts that are used for automated log in, such as the user accounts used for Manager Forwarding Connectors. These user accounts can be excluded from password expiration using the following key in `server.properties`:

```
auth.password.age.exclude=username1,username2
```

This value is a comma-separated list of usernames. The passwords of these users never expire.

ArcSight Manager can also keep a history of a user's passwords to make sure that passwords are not reused. The number of last passwords to keep is specified using the following key in `server.properties`:

```
auth.password.different.min=1
```

By default, this key is set to check only the last password (value = 1). You can change this key to keep up to last 20 passwords.

## Restricting the Number of Failed Log Ins

ArcSight Manager tracks the number of failed log in attempts to prevent brute force password guessing attacks. By default, a user's account is disabled after three failed log in attempts. This feature is controlled through the following key in `server.properties`:

```
auth.failed.max=3
```

Change this to the desired number or to `-1` if you do not wish user accounts to be disabled, regardless of the number of failed log in attempts.

Once a user account has been disabled, ArcSight Manager can be configured to automatically re-enable it after a certain period of time. This will reduce the amount of administrative overhead, while at the same time effectively preventing brute force attacks. This mechanism is controlled by the following key in `server.properties`:

```
auth.auto.reenable.time=10
```

This value specifies the time, in minutes, after which user accounts are automatically re-enabled after they were disabled due to an excessive number of incorrect log ins. Set the property key to `-1` to specify that user accounts can only be re-enabled manually.

## Re-Enabling User Accounts

Under normal circumstances, user accounts that have been disabled—for example, as a result of too many consecutive failed log ins—can be re-enabled by any user with sufficient permission. Check the **Enabled** check box for a particular user in the User Inspect/Editor panel in the ArcSight Console.

If there is no user with sufficient privileges remaining enabled—for example, if the only remaining administrator user account is disabled—a command line tool can be run on the system where ArcSight Manager is installed to re-enable user accounts. First, ensure that the ArcSight Manager is running. Then, from the command line, run the following command:

```
./arcsight reenableuser username
```

where username is the name of the user you want to re-enable. After this procedure, the user can log in again, using the unchanged password.

## Advanced Configuration Options for Asset Auto-Creation

Assets are automatically created for all components and, if applicable, for assets arriving from scan reports sent by vulnerability scanners via scanner SmartConnectors. This is done by the asset auto-creation feature.

If the profile of events in your network causes asset auto creation feature to create assets in your network model inefficiently, you can modify the asset auto creation default settings in the user configuration file, `server.properties`.

The server.properties file is located at  
`$ARCSIGHT_HOME/config/server.properties`.

For more about working with properties files, see the topic “Managing and Changing Properties File Settings”

## Asset Auto-Creation from Scanners in Dynamic Zones

The following properties relate to how assets are created from a vulnerability scan report for dynamic zones.

### Create Asset if either IP Address or Host Name

By default, an asset is not created in a dynamic zone if there is no host name present. The property set by default is:

```
scanner-event.dynamiczone.asset.nonidentifiable.create=false
```

You can configure ArcSight Express v3.0 to create the asset as long as it has either an IP address or a host name. In `server.properties`, change `scanner-event.dynamiczone.asset.nonidentifiable.create` from **false** to **true**.

ArcSight Express v3.0 discards conflicts between an IP address and host name (similar IP address, but different host name and/or MAC address).

**Caution**

**Creating an asset if no host name is present can result in an inaccurate asset model.**

Setting `scanner-event.dynamiczone.asset.nonidentifiable.create` to `true` means that assets are created if the asset has either an IP address or a host name.

This could lead to disabled assets or duplicated assets being created. Change this configuration only if you are using a dynamic zone to host ostensibly static assets, such as long-lived DHCP addresses.

When this property is set to `true`, the following takes place:

| Example                                           | Action taken if no conflicts                                   | Action taken if previous asset with similar information        |
|---------------------------------------------------|----------------------------------------------------------------|----------------------------------------------------------------|
| IP=1.1.1.1<br>hostname=myhost<br>mac=0123456789AB | Asset created                                                  | Asset created, previous asset is deleted.                      |
| ip=1.1.1.1<br>hostname=myhost<br>mac=null         | Asset created                                                  | Asset created, previous asset is deleted.                      |
| ip=1.1.1.1<br>hostname=null<br>mac=0123456789AB   | Asset created                                                  | Asset created, previous asset is deleted.                      |
| ip=1.1.1.1<br>hostname=null<br>mac=null           | Asset created                                                  | Asset created, previous asset is deleted.                      |
| ip=null<br>hostname=myhost<br>mac=null            | Asset created                                                  | Asset created, previous asset is deleted.                      |
| ip=null<br>hostname=null<br>mac=0123456789AB      | Asset not created. Either host name or IP address is required. | Asset not created. Either host name or IP address is required. |
| ip=null<br>hostname=myhost<br>mac=0123456789AB    | Asset not created. Either host name or IP address is required. | Asset not created. Either host name or IP address is required. |

## Preserve Previous Assets

This setting applies when ArcSight Express v3.0 creates assets from a vulnerability scan report for dynamic zones. By default, if a previous asset with similar information already exists in the asset model, ArcSight Express v3.0 will create a new asset and delete the old one.

If you want to preserve the previous asset rather than delete it when a scan finds a new asset with similar information, you can configure ArcSight Express v3.0 to rename the

previous asset. In `server.properties`, change `scanner-event.dynamiczone.asset.ipconflict.preserve` from **false** to **true**.

#### Preserving previous assets results in a larger asset model.

Setting `event.dynamiczone.asset.ipconflict.preserve` to true means that assets are continually added to the asset model and not removed. Use this option only if you know you must preserve all assets added to the asset model.

When ArcSight Express v3.0 is configured with `scanner-event.dynamiczone.asset.nonidentifiable.create=false` and `scanner-event.dynamiczone.asset.ipconflict.preserve=true`, it takes the following actions:

| Example                                           | Action taken if previous asset with similar information and preserve = true |
|---------------------------------------------------|-----------------------------------------------------------------------------|
| IP=1.1.1.1<br>hostname=myhost<br>mac=0123456789AB | Asset created, previous asset is renamed.                                   |
| ip=1.1.1.1<br>hostname=myhost<br>mac=null         | Asset created, previous asset is renamed.                                   |
| ip=1.1.1.1<br>hostname=null<br>mac=0123456789AB   | Asset created, previous asset is renamed.                                   |
| ip=1.1.1.1<br>hostname=null<br>mac=null           | No action taken. Either host name or MAC address is required.               |
| ip=null<br>hostname=myhost<br>mac=null            | Asset created, previous asset is renamed.                                   |
| ip=null<br>hostname=null<br>mac=0123456789AB      | Asset created, previous asset is renamed.                                   |
| ip=null<br>hostname='myhost'<br>mac=0123456789AB  | Asset created, previous asset is renamed.                                   |

## Changing the Default Naming Scheme

By default, ArcSight Express v3.0 names assets that come from scanners using the naming scheme outlined in ["Asset Names" on page 747](#) in the *ArcSight Express v3.0 User's Guide*.

|                  | Static Zone                                   | Dynamic Zone                                              |
|------------------|-----------------------------------------------|-----------------------------------------------------------|
| <b>Property:</b> | scanner-event.auto-create.asset.name.template | scanner-event.auto-create.dynamiczone.asset.name.template |
| <b>Value:</b>    | \$destinationAddress - \$!destinationHostName | \$destinationHostName                                     |
| <b>Example:</b>  | 1.1.1.1 - myhost                              | myhost                                                    |

You can reconfigure this default naming scheme, for example, if you want to show the host name first, or use an underscore to separate the elements.

For example, you want the asset name for an asset in a static zone to appear this way in the ArcSight Express v3.0 UI:

```
myhost_1.1.1.1
```

In this case, change the default

```
$destinationAddress - $!destinationHostName
```

to

```
$!destinationHostName_$destinationAddress
```

## Compression and Turbo Modes

### Enabling Compression for ArcSight SmartConnector Events

ArcSight SmartConnectors can send event information to the ArcSight Manager in a compressed format using HTTP compression. The compression technique used is standard GZip, providing compression ratio of 1:10 or higher, depending on the input data (in this case, the events the ArcSight SmartConnector is sending). Using compression lowers the overall network bandwidth used by ArcSight SmartConnectors dramatically, without impacting their overall performance.

By default, all ArcSight SmartConnectors have compression enabled. To turn it off, add the following line to the `<ARCSIGHT_HOME>/user/agent/agent.properties` file:

```
compression.enabled = false
```

ArcSight SmartConnectors will determine whether the ArcSight Manager they are sending events to supports compression (ArcSight Manager version 2.2 or later).

## Understanding ArcSight Turbo Modes

If your configuration, reporting, and analytic usage permits, you can accelerate the transfer of sensor information through SmartConnectors by choosing one of the "turbo" modes. The

default transfer mode is called Complete, which passes all the data arriving from the device, including any additional data (custom, or vendor-specific).

ArcSight SmartConnectors can be configured to send more or less event data, on a per-SmartConnector basis, and the ArcSight Manager can be set to read and maintain more or less event data, independent of the SmartConnector setting. Some events require more data than others. For example, operating system syslogs often capture a considerable amount of environmental data that may or may not be relevant to a particular security event. Firewalls, on the other hand, typically report only basic information.

ArcSight defines the following Turbo Modes:

| Turbo Modes |         |                           |
|-------------|---------|---------------------------|
| 1           | Fastest | Recommended for firewalls |
| 2           | Faster  | Manager default           |

When Turbo Mode is not specified (mode 3, Complete), all event data arriving at the SmartConnector, including additional data, is maintained. (Versions of ArcSight prior to 3.0 ran in Turbo Mode 3.) Turbo Mode 2, Faster, eliminates the additional custom or vendor-specific data, which is not required in many situations. Turbo Mode 1, Fastest, eliminates all but a core set of event attributes, in order to achieve the best throughput. Because the event data is smaller, it requires less storage space and provides the best performance. It is ideal for simpler devices such as firewalls.

The ArcSight Manager processes event data using its own Turbo Mode setting. If SmartConnectors report more event data than the Manager needs, the Manager ignores the extra fields. On the other hand, if the Manager is set to a higher Turbo Mode than a SmartConnector, the Manager will maintain fields that are not filled by event data. Both situations are normal in real-world scenarios, because the Manager configuration reflects the requirements of a diverse set of SmartConnectors.

Event data transfer modes are numbered (1 for Fastest, 2 for Faster, 3 for Complete), and possible Manager-SmartConnector configurations are therefore:

- 1-1 Manager and SmartConnector in Fastest mode
- 1-2 SmartConnector sending more sensor data than Manager needs
- 1-3 SmartConnector sending more sensor data than Manager needs
- 2-1 SmartConnector not sending all data that Manager is storing\*
- 2-2 Manager and SmartConnector in Faster mode
- 2-3 Default: Manager does not process additional data sent by SmartConnector
- 3-1 Manager maintains Complete data, SmartConnector sends minimum\*
- 3-2 Manager maintains additional data, but SmartConnector does not send it
- 3-3 Manager and SmartConnector in Complete mode

\*When the SmartConnector sends minimal data (Turbo Mode 1), the Manager can infer some additional data, creating a 2-1.5 or a 3-1.5 situation.

## Sending Events as SNMP Traps

ArcSight can send a sub-stream of all incoming events (that includes rule-generated events) via SNMP to a specified target. A filter is used to configure which events will be sent. ArcSight's correlation capabilities can be used to synthesize network management events that can then be routed to your enterprise network management console.

### Configuration of the SNMP trap sender

The SNMP trap sender is configured using the ArcSight Manager configuration file. The `<ARCSIGHT_HOME>/config/server.default.properties` file includes a template for the required configuration values. Copy those lines into your `<ARCSIGHT_HOME>/config/server.properties` file and make the changes there. After making changes to this file, you need to restart the ArcSight Manager.

Setting the Manager to send SNMP v3 traps is not FIPS compliant. This is because SNMP v3 itself uses MD5 algorithm. However, SNMPv1 and v2 are compliant.

---

properties: The following provides a description of specific SNMP configuration parameters:

```
snmp.trapsender.enabled=true
```

Set this property to true in order to enable the SNMP trap sender.

```
snmp.trapsender.uri=
```

```
/All Filters/Arcsight System/SNMP Forwarding/SNMP Trap Sender
```

The filter (specified by URI, all on one line) is used to decide whether or not an event is forwarded. There is no need to change the URI to another filter, as the "SNMP Trap Sender" filter can be changed through the ArcSight Console. Changes to the filter specified will immediately affect the SNMP trap sender. By default, the "SNMP Trap Sender" filter logic is Matches Filter (Correlated Events)—that is, only rules-generated events will be forwarded.

```
snmp.destination.host=
```

```
snmp.destination.port=162
```

The host name and the port of the SNMP listener that wants to receive the traps.

```
snmp.read.community=public
```

```
snmp.write.community=public
```

The SNMP community strings needed for the traps to make it through to the receiver. The read community is reserved for future use, however, the write community must match the community of the receiving host. This will depend on your deployment environment and your receiving device. Please consult your receiving device's documentation to find out which community string should be used.

```
snmp.version=1
```

```
snmp.fields=\
```

```
event.eventId,\
```

```

event.eventName,\
event.eventCategory,\
event.eventType,\
event.baseEventCount,\
event.arcsightCategory,\
event.arcsightSeverity,\
event.protocol,\
event.sourceAddress,\
event.targetAddress

```

These event attributes should be included in the trap. The syntax follows the SmartConnector SDK as described in the *FlexConnector Developer's Guide*. All the ArcSight fields can be sent. The identifiers are case sensitive, do not contain spaces and must be capitalized except for the first character. For example:

| ArcSight Field  | SDK/SNMP trap sender identifier |
|-----------------|---------------------------------|
| Event Name      | eventName                       |
| Device Severity | deviceSeverity                  |
| Service         | service                         |

The SNMP field types will be converted as:

|          |              |
|----------|--------------|
| ArcSight | SNMP         |
| STRING   | OCTET STRING |
| INTEGER  | INTEGER32    |
| Address  | IP ADDRESS   |
| LONG     | OCTET STRING |
| BYTE     | INTEGER      |

Additional data values are accessible by name, for example:

```
snmp.fields=event.eventName,additionaldata.myvalue
```

This will send the Event Name field and the value of `myvalue` in the additional data list part of the SNMP trap. Only the String data type is supported for additional data, therefore all additional data values will be sent as `OCTET STRING`.

## Asset Aging

ESM v5.0 introduces two ways in which the age of a scanned asset is taken into consideration. The age of an asset is defined as the number of days since it was last modified. So, for example, if an asset was last modified 29 hours ago, the age of the asset will be taken as 1 day and the remaining time (5 hours, in our example) will be ignored in the calculation of the asset's age.

## Excluding Assets From Aging

To exclude certain assets from aging, you can add those assets to a group and then set the property `asset.aging.excluded.groups.uris` in the `server.properties` file to the URI(s) of those groups.

For example, to add the groups `MyAssets` and `DontTouchThis` (both under All Assets) add the following to the `server.properties` file:

```
#Exclude MyAssets and DontTouchThis from aging
asset.aging.excluded.groups.uris=/All Assets/MyAssets,/All
Assets/DontTouchThis
```

When setting the `asset.aging.excluded.groups.uris` property keep in mind that the assets in this group will not be disabled, deleted or amortized.

## Task to Disable Assets of a Certain Age

By default, asset aging is disabled. There is a new scheduled task that will disable any scanned asset that has reached the specified age. By default, once the assets aging feature is turned on this task will run every day half an hour after midnight (00:30:00). Add the following in the `server.properties` file to define asset aging:

```
#-----
# Asset aging
#-----
# Defines how many days can pass before a scanned asset is defined
as old
# after this time the asset will be disabled
# Default value: disabled
asset.aging.daysbeforedisable = -1
```

## To Delete an Asset

To delete the asset instead of disabling it, you have to set the property `asset.aging.task.operation` to `delete` in `server.properties` file:

```
# Delete assets when they age

asset.aging.task.operation = delete
```

## Amortize Model confidence with scanned asset age

The `IsScannedForOpenPorts` and `IsScannedForVulnerabilities` subelements in the `ModelConfidence` element will be factored by the age of an asset. they will be extended to include an optional attribute, `AmortizeScan`. If `AmortizeScan` is not defined (or defined with value -1), the assets will not be amortized. A "new" asset will get the full value while and "old" asset will get no points. You can edit the `AmortizeScan` value (number of days) in the Manager's `/config/server/ThreatLevelFormula.xml` file:

```
<ModelConfidence>
  <Sum MaxValue="10" Weight="10">
    <!-- If target Asset is unknown, clamp modelConfidence to 0 -->
    <!--
    <HasValue FIELD="targetAssetId" Value="-10" Negated="Yes" />
    <HasValue FIELD="targetAssetId" Value="4" Negated="NO" />
  </Sum>
</ModelConfidence>
```

```

<!-- Give 4 points each for whether the target asset has been
      scanned for open ports          and vulnerabilities -->
<!-- This values can be amortized by the age of the asset -->
<!-- that means that the value will reduce constantly over
      time as the asset age -->
<!-- ie if you set the value to be 120 on the day the assets
      are created they receive the          four points, by day 60
      they'll receive 2 points and by day 120 they'll receive 0
      points          -->
<IsScannedForOpenPorts Value="4" Negated="NO"
  AmortizeScan="-1" />
<IsScannedForVulnerabilities Value="4" Negated="NO"
  AmortizeScan="-1" />
</Sum>
</ModelConfidence>

```

For this example, the value will be modified as follows:

| Asset Age<br>(in days) | AmortizeScan Value |
|------------------------|--------------------|
| 0                      | 4                  |
| 60                     | 2                  |
| 120                    | 0                  |
| 240                    | 0                  |

## Chapter 3

# Managing Resources

---

Some administrator tasks necessary to manage ArcSight Express v3.0 are performed in the ArcSight Console. The details for performing such tasks are documented in the Online Help and also in the *ArcSight Express v3.0 User's Guide*. This chapter points you to the location where these tasks are documented in the *ArcSight Express v3.0 User's Guide*.

## Appendix A

# ArcSight Commands

---

This appendix provides information about ArcSight command scripts and utility programs. This appendix is divided into the following sections:

[“Running an ArcSight Command Script” on page 87](#)

[“Alphabetic List of Commands” on page 88](#)

## Running an ArcSight Command Script

To run an ArcSight command script on a component, open a command window and switch to the `<ARCSIGHT_HOME>/bin` directory. Execute the following command:

```
arcsight command_name [parameters]
```

The following sections describe the supported ArcSight commands.

# Alphabetic List of Commands

## ACLReportGen

|                    |                                                                                                                                                                                                   |                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | A tool for generating a report on ACLs either at the group level or at the user level. By default, the generated report is placed in the <code>/opt/arcsight/manager/ACLReports</code> directory. |                                                                                                                                                                                                 |
| <b>Applies to</b>  | Manager                                                                                                                                                                                           |                                                                                                                                                                                                 |
| <b>Syntax</b>      | <code>ACLReportGen &lt;parameters&gt;</code>                                                                                                                                                      |                                                                                                                                                                                                 |
| <b>Options</b>     | Optional:                                                                                                                                                                                         |                                                                                                                                                                                                 |
|                    | <code>-config &lt;config&gt;</code>                                                                                                                                                               | The primary configuration file (config/server.defaults.properties)                                                                                                                              |
|                    | <code>-locale</code>                                                                                                                                                                              | The locale to run under                                                                                                                                                                         |
|                    | <code>-m &lt;mode&gt;</code>                                                                                                                                                                      | Mode in which this tool is run to generate the ACLs report. Supported modes are <ul style="list-style-type: none"> <li>• grouplevel</li> <li>• userlevel</li> </ul> Default value is grouplevel |
| <b>Options</b>     | <code>-pc &lt;privateConfig&gt;</code>                                                                                                                                                            | The override configuration file (config/server.properties)                                                                                                                                      |
|                    | <code>-h help</code>                                                                                                                                                                              |                                                                                                                                                                                                 |
| <b>Examples</b>    | To run this tool:<br><code>arcsight ACLReportGen</code>                                                                                                                                           |                                                                                                                                                                                                 |

## agent logfu

|                    |                                                       |                                                             |
|--------------------|-------------------------------------------------------|-------------------------------------------------------------|
| <b>Description</b> | Graphical SmartConnector log file analyzer            |                                                             |
| <b>Applies to</b>  | SmartConnectors                                       |                                                             |
| <b>Syntax</b>      | <code>agent logfu -a [options]</code>                 |                                                             |
| <b>Options</b>     | <code>-a</code>                                       | SmartConnector log. Required.                               |
|                    |                                                       | For other options, see <code>logfu</code> command (Manager) |
| <b>Examples</b>    | To run logfu:<br><code>arcsight agent logfu -a</code> |                                                             |

## agent tempca

|                    |                                                                             |
|--------------------|-----------------------------------------------------------------------------|
| <b>Description</b> | Inspect and manage temporary certificates for a SmartConnector host machine |
|--------------------|-----------------------------------------------------------------------------|

|                   |                                                        |
|-------------------|--------------------------------------------------------|
| <b>Applies to</b> | SmartConnectors                                        |
| <b>Syntax</b>     | <code>agent tempca</code>                              |
| <b>Options</b>    | For options, see <code>tempca</code> command (Manager) |
| <b>Examples</b>   | To run:<br><code>arcsight agent tempca</code>          |

## agentcommand

|                    |                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Send a command to SmartConnectors                                                                                                                                                                                                                                                                 |
| <b>Applies to</b>  | SmartConnectors                                                                                                                                                                                                                                                                                   |
| <b>Syntax</b>      | <code>agentcommand -c (restart   status   terminate)</code>                                                                                                                                                                                                                                       |
| <b>Options</b>     | <code>-c</code> Command: <code>restart</code> , <code>status</code> , or <code>terminate</code>                                                                                                                                                                                                   |
| <b>Examples</b>    | <p>To retrieve status properties from the SmartConnector:</p> <pre>arcsight agentcommand -c status</pre> <p>To terminate the SmartConnector process:</p> <pre>arcsight agentcommand -c terminate</pre> <p>To re-start the SmartConnector process:</p> <pre>arcsight agentcommand -c restart</pre> |

| <b>Description</b> | Run the SmartConnector Configuration Wizard                                                                                                                                                                                                                                                                                                                 |
| <b>Applies to</b>  | SmartConnectors                                                                                                                                                                                                                                                                                                                                             |
| <b>Syntax</b>      | <code>agentsetup [-i mode] [-w] [-f file] [-g] [-t type] [-sn name]</code>                                                                                                                                                                                                                                                                                  |
| <b>Options</b>     | <p><code>-a</code> Show connectors for all platforms</p> <p><code>-f file</code> Properties file (required in <code>-i</code> silent mode)</p> <p><code>-g</code> Generate sample properties file for use in <code>-i</code> silent mode</p> <p><code>-h</code> Get help on agentsetup command</p> <p><code>-i mode</code> Mode: silent, console, swing</p> |

|                       |                                            |
|-----------------------|--------------------------------------------|
| <code>-R</code>       | Re-register an connector                   |
| <code>-sn name</code> | Short Name                                 |
| <code>-t type</code>  | SmartConnector Type (overrides short name) |
| <code>-w</code>       | Run in wizard mode                         |

---

**Examples**

To run the SmartConnector Configuration Wizard:

`arcsight agentsetup`

---

## agentsvc

|                    |                                               |                          |
|--------------------|-----------------------------------------------|--------------------------|
| <b>Description</b> | Install ArcSight SmartConnector as a service. |                          |
| <b>Applies to</b>  | SmartConnectors                               |                          |
| <b>Syntax</b>      | <code>agentsvc -i -u user</code>              |                          |
| <b>Options</b>     | <code>-i</code>                               | Install the service      |
|                    | <code>-u</code>                               | Run service as user user |
| <b>Examples</b>    | To install a SmartConnector as a service:     |                          |
|                    | <code>arcsight agentsvc</code>                |                          |

## agenttempca

|                    |                              |
|--------------------|------------------------------|
| <b>Description</b> | See the agent tempca command |
| <b>Applies to</b>  | SmartConnectors              |

## agentup

|                    |                                                                                                                       |  |
|--------------------|-----------------------------------------------------------------------------------------------------------------------|--|
| <b>Description</b> | Get the current state of a SmartConnector. Returns 0 if the SmartConnector is running and reachable. Returns 1 if not |  |
| <b>Applies to</b>  | SmartConnectors                                                                                                       |  |
| <b>Syntax</b>      | <code>agentup</code>                                                                                                  |  |
| <b>Options</b>     | None                                                                                                                  |  |
| <b>Examples</b>    | To check that the SmartConnector is up, running, and accessible:                                                      |  |
|                    | <code>arcsight agentup</code>                                                                                         |  |

## arcdt

|                    |                                                                                                                                                                                                                                                |  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Description</b> | A utility that enables you run diagnostic utilities such as session wait times, thread dumps, and database alert logs about your ArcSight system, which helps ArcSight Customer Support analyze performance issues on your ArcSight components |  |
| <b>Applies to</b>  | Manager                                                                                                                                                                                                                                        |  |
| <b>Syntax</b>      | <code>arcdt diagnostic_utility utility_options</code>                                                                                                                                                                                          |  |

`diagnostic_utility`

Utilities you can run are:

- `runsql`—Run SQL commands contained in a file that is specified as a parameter of this utility.

Required Parameters:

`-f <sqlfile>` The file containing the sql statement to be executed.

Optional Parameters:

`-fmt <format>` The format the output should be displayed in (where relevant), choices are: html/text (text)

`-o <outputfile>` File name to save output to. ()

`-rc <row_count>` The number of rows to be shown as a result of a select. (10000)

`-se <sessionEnd>` if type is EndTime or mrt, value will be like yyyy-MM-dd-HH-mm-ss-SSS-zzz; if type is EventId, value will be a positive integer indicating the end of eventId. (2011-06-30-01-00-00-000-GMT)

`-sr <start_row>` The row number from which you want data to be shown (0)

`-ss <sessionStart>` if type is EndTime or mrt, value will be like yyyy-MM-dd-HH-mm-ss-SSS-zzz; if type is EventId, value will be a positive integer indicating the end of eventId. (2011-06-30-00-00-00-000-GMT)

`-t <terminator>` The character that separates SQL statements in the input file. (;)

`-type <type>` Session type for sql query: EndTime, mrt, or EventId (EndTime)

Options:

`-cmt commit` - Flag indicating whether all inserts and updates should be committed before exiting.

`-sp spool` - Flag specifying whether output should be saved to disk or not.

## Options

- `session-waits`—Retrieve the currently running JDBC (Java Database Connection) sessions and their wait times.

Required Parameters:

`-sp spool` - Flag specifying whether output should be saved to disk or not.

Optional Parameters:

`-c <count>` The number of times we want to query the various session tables. (5)

`-f <frequency>` The time interval (in seconds) between queries to the session tables. (20)

`-fmt <format>` The format the output should be displayed in (where relevant), choices are: html/text (text)

`-o <outputfile>` File name to save output to. ()

- `thread-dumps`—Obtain thread dumps from the Manager. Optional parameters which can be specified

`-c <count>` The number of thread dumps to request. (3)

`-f <frequency>` The interval in SECONDS between each thread dump request. (10)

`-od <outputdir>` The output directory into which the requested thread dumps have to be placed. ()

`utility_options` To see the options available for each utility, run this command in `<ARCSIGHT_HOME>/bin`:

```
arcdt help diagnostic_utility
```

---

To find out the number of cases in your database:

- 1 Create a file called `sample.txt` in `<ARCSIGHT_HOME>/temp` on the Manager with this SQL command:

```
select count(*) from arc_resource where  
resource_type=7;
```

#### Examples

- 2 Run this command in `<ARCSIGHT_HOME>/bin`:

```
arcdt runsql temp/sample.txt
```

To retrieve the last 20 lines of database alert log from your database machine and save it to a file called `20110720_dblog`, run this command:

```
arcdt db-alertlog -ln 20 -o 20110720_dblog
```

---

| Options | <code>-action action</code>             | Possible actions include: <code>diff</code> , <code>export</code> , <code>il8nsync</code> , <code>import</code> , <code>list</code> , <code>merge</code> , and <code>sort</code> .<br>Default: <code>export</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|         | <code>-all</code>                       | Export all resources in the system (not including events)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|         | <code>-base basefile</code>             | The basefile when creating a migration archive. The new archive file is specified with <code>-source</code> (the result file is specified with <code>-f</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|         | <code>-config file</code>               | Configuration file to use.<br>Default:<br><code>config/server.defaults.properties</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|         | <code>-exportaction exportaction</code> | The action attribute to assign to each resource object exported. Export actions are:<br><br><code>insert</code> : Insert the new resource if it doesn't exist.<br><br><code>update</code> : Update a resource if it exists.<br><br><code>remove</code> : Remove a resource if it exists.<br><br>Default: <code>insert</code>                                                                                                                                                                                                                                                                                                                                                                                                |
|         | <code>-f archivefile</code>             | The input (import) or the output (export) file specification.<br><b>Note:</b> Filename paths can be absolute or relative. Relative paths are relative to <code>&lt;ARCSIGHT_HOME&gt;</code> , not the current directory. Required                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|         | <code>-format fmt</code>                | Format of the archive: <code>preferarchive</code> , <code>force</code> , <code>interactive</code> , <code>overwrite</code> or <code>skip</code> .<br>Default: <code>default</code> .<br><br><code>default</code> : Prompts user to resolve import conflicts.<br><br><code>force</code> : Conflicts are resolved by the new overwriting the old.<br><br><code>overwrite</code> : Merges resources, but does not perform any union of relationships.<br><br><code>preferarchive</code> : Merges resources. For example, if a group is imported, the resulting group will contain all its original members and all of the new members from the import file.<br><br><code>skip</code> : Do not import resources with conflicts. |
|         | <code>-h</code>                         | Get help for this command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|         | <code>-i</code>                         | (Synonym for <code>-action import</code> .)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|         | <code>-m manager</code>                 | The ArcSight Manager to communicate with                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                 |                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-newids</code>            | All archival objects within an archive will be given new IDs. All refs to these archival objects will be changed to the new ID or removed if not found. This option is useful when an archive is created and then all resources in the archive are modified to create new resources but the IDs were retained                                                                             |
| <code>-o</code>                 | Overwrite any existing files                                                                                                                                                                                                                                                                                                                                                              |
| <code>-optimizedimport</code>   | Performs pre-processing during import for optimization. Forces the import of values even though they are the same as what is stored in the database. If this flag is not set, each of the values in the archive will be compared with the value in the database to determine whether any changes have been made; if no changes are found, then the import for that object will be skipped |
| <code>-p password</code>        | Password with which to log in to the Manager                                                                                                                                                                                                                                                                                                                                              |
| <code>-param paramfile</code>   | The source file for parameters. Any parameters in the paramfile can be overridden by command line values                                                                                                                                                                                                                                                                                  |
| <code>-pc configfile</code>     | Private configuration file to override <code>-config</code> . Default: <code>config/server.properties</code>                                                                                                                                                                                                                                                                              |
| <code>-pkcs11</code>            | Use this option when authenticating with a PKCS#11 provider. For example,<br><br><code>arcsight archive -m &lt;hostname&gt; -pkcs11 -f &lt;file path&gt;</code>                                                                                                                                                                                                                           |
| <code>-port port</code>         | The port to use for Manager communication. Default: 8443                                                                                                                                                                                                                                                                                                                                  |
| <code>-q</code>                 | Quiet: do not output progress information while archiving                                                                                                                                                                                                                                                                                                                                 |
| <code>-source sourcefile</code> | The source file used when <code>-f</code> specifies an output file                                                                                                                                                                                                                                                                                                                        |
| <code>-standalone</code>        | Operate directly on the Database, not the Manager.<br><br><b>Warning:</b> Do not run archive in <code>-standalone</code> mode when the Manager is running; database corruption could result.                                                                                                                                                                                              |
| <code>-u username</code>        | The user name to log in to the Manager with                                                                                                                                                                                                                                                                                                                                               |
| <code>-uri includeURIs</code>   | The URI(s) to export. No effect during import. All dependent resources are exported, as well—for example, all children of a group.<br><br>Separate multiple URIs (such as <code>"/All Filters/Geographic/West Coast"</code> ) with a space, or repeat the <code>-uri</code> switch                                                                                                        |

---

|                                         |                                                                                                                                                                                                                                                     |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-urichildren<br/>includes</code>  | The parent URI(s) to export. No effect during import. All child resources of the specified resources will be exported. The parent resources are only exported if there is a dependency                                                              |
| <code>-xrefids</code>                   | Exclude reference IDs. This option determines whether to include reference IDs during export. This is intended only to keep changes to a minimum between exports. Do not use this option without a complete understanding of its implications       |
| <code>-xtype<br/>excludeTypes</code>    | The type(s) to exclude during export. No effect during import. Exclude types must be valid type names, such as Group, Asset, or ActiveChannel                                                                                                       |
| <code>-xtyperef<br/>excludeTypes</code> | Same as the <code>-xtype</code> option, but will also exclude all references of the specified type                                                                                                                                                  |
| <code>-xuri<br/>excludeURIs</code>      | The URI(s) to exclude during export. No effect during import. Resources for which all possible URIs are explicitly excluded will not be exported. Resources which can still be reached by a URI that is not excluded will still be exported         |
| <code>-xurichildren<br/>excludes</code> | The parent URI(s) to exclude during export. No effect during import. Resources for which all possible URIs are explicitly excluded will not be exported. Resources which can still be reached by a URI that is not excluded will still be exported. |

---

---

To import resources from an XML file (on a Unix host):

```
arcsight archive -action import -f  
/user/subdir/resfile.xml
```

To export certain resources (the program displays available resources):

```
arcsight archive -f resfile.xml -u admin -m mgrName -p pwd
```

To export all resources to an XML file in quiet, batch mode:

```
arcsight archive -all -q -f resfile.xml -u admin -m  
mgrName p password
```

To export a specific resource:

**Examples**

```
arcsight archive -uri "/All Filters/Geographic/West Coast"  
f resfile.xml
```

Manual import (program prompts for password):

```
arcsight archive -i -format preferarchive -f resfile.xml -  
u admin m mgrName
```

Scheduled or batch importing:

```
arcsight archive -i -q -format preferarchive -f  
resfile.xml -u admin -m mgrName p password
```

Scheduled or batch exporting:

```
arcsight archive -f resfile.xml -u admin -m mgrName p  
password uri "/All Filters/Geographic/East Coast" -uri  
"/All Filters/Geographic/South"
```

---

## archivefilter

|                    |                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Use the command to change the contents of the archive. The archivefilter command takes a source archive xml file as input, applies the filter specified and writes the output to the target file. |                                                                                                                                                                                                                                                                                   |
| <b>Applies to</b>  | Manager                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                   |
| <b>Syntax</b>      | <code>archivefilter -source sourcefile -f archivefile [options]</code>                                                                                                                            |                                                                                                                                                                                                                                                                                   |
| <b>Options</b>     | <code>-a action</code>                                                                                                                                                                            | Action to perform { <code>insert</code> , <code>remove</code> , <code>none</code> } (Default: <code>none</code> )                                                                                                                                                                 |
|                    | <code>-e element_list</code>                                                                                                                                                                      | Elements to process (Default: <code>''</code> which denotes all elements)                                                                                                                                                                                                         |
|                    | <code>-extid regex</code>                                                                                                                                                                         | Regular expression to represent all of the external IDs to include. This is the external ID of the archival object. (Default: <code>none</code> )                                                                                                                                 |
|                    | <code>-f file</code>                                                                                                                                                                              | Target file (required). If a file with an identical name already exists in the location where you want to create your target file, the existing file will be overwritten. If you would like to receive a prompt before this file gets overwritten, use the <code>-o</code> option |
|                    | <code>-o</code>                                                                                                                                                                                   | Overwrite existing target file without prompting (Default: <code>false</code> )                                                                                                                                                                                                   |
|                    | <code>-relateduri regex</code>                                                                                                                                                                    | Regular expression to get all of the URIs found in references to include. This will check all attribute lists that have references and if any of them have a URI that matches any of the expressions, that object will be included                                                |
|                    | <code>-source file</code>                                                                                                                                                                         | Source file (required)                                                                                                                                                                                                                                                            |

|                    | <code>-h</code>                                                                                                                                                                                   | Help for this command                                                                                                                                                                                                                                                             |

**Examples**

To include any resources, for example all Active Channels, whose attributes contain the URI specified by the `-relateduri` option:

```
arcsight archivefilter -source allchannels.xml -f t0.xml -
relateduri "/All Active Channels/ArcSight
Administration/"
```

To include any resources whose parent URI matches the URI specified by the `-uri` option:

```
arcsight archivefilter -source allchannels.xml -f t0.xml -
uri "/All Active Channels/ArcSight Administration/.*"
```

To exclude resources whose parent URI matches the URI specified by the `-xuri` option:

```
arcsight archivefilter -source allchannels.xml -f t0.xml -
xuri "/All Active Channels/.*"
```

To include all the resources that contain either URIs specified by the two `-relateduri` options:

```
arcsight archivefilter -source allchannelsFilter.xml -f
t0.xml -relateduri "/All Active Channels/ArcSight
Administration/" -relateduri ".*Monitor.*"
```

## bleep

**Description**

Unsupported stress test tool to supply a Manager with security events from replay files (see [replayfilegen](#)). Replay files containing more than 30,000 events require a lot of memory on the bleep host.

Do not run bleep on the Manager host. Install the Manager on the bleep host and cancel the configuration wizard when it asks for the Manager's host name.

Run `arcsight tempca -ac` on the bleep host if the Manager under test is using a demo certificate.

Create the file `config/bleep.properties` using the descriptions in `bleep.defaults.properties`.

**Applies to**

Manager

**Syntax**

```
bleep [-c file] [-D key=value [key=value...]]
```

**Options**

|                           |                                                                               |
|---------------------------|-------------------------------------------------------------------------------|
| <code>-c file</code>      | Alternate configuration file (default: <code>config/bleep.properties</code> ) |
| <code>-D key=value</code> | Override definition of configuration properties                               |
| <code>-m n</code>         | Maximum number of events to send. (Default: -1)                               |
| <code>-n host</code>      | Manager host name                                                             |
| <code>-p password</code>  | Manager password                                                              |
| <code>-t port</code>      | Manager port (Default: 8443)                                                  |
| <code>-u username</code>  | Manager user name                                                             |

|                 |                             |                      |
|-----------------|-----------------------------|----------------------|
|                 | <code>-h</code>             | Display command help |
| <b>Examples</b> | To run:                     |                      |
|                 | <code>arcsight bleep</code> |                      |

## bleepsetup

|                    |                                                              |                                                              |

| <b>Options</b>    | None                                                                   |
| <b>Examples</b>   | To launch the iDefense Setup wizard:<br><br><code>idefensesetup</code> |

## import\_system\_tables

|                    |                                                                                                                                                                                                          |                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Utility to import database tables. The file you import from must be the one that export_system_tables utility created. This utility looks for the arcsight.dmp file in the database's <ARCSIGHT_HOME>.   |                                                                                                                  |
| <b>Applies to</b>  | Manager, Database                                                                                                                                                                                        |                                                                                                                  |
| <b>Syntax</b>      | <code>import_system_tables &lt;old_arcsight_user&gt;<br/>&lt;new_arcsight_user&gt; &lt;password&gt; &lt;db_instance&gt;<br/>&lt;dump_file_path&gt; &lt;dump_file_name&gt;</code>                         |                                                                                                                  |
| <b>Options</b>     | <code>export_username</code>                                                                                                                                                                             | The database username that was used to export system tables using the <code>export_system_tables</code> command. |
|                    | <code>import_username</code>                                                                                                                                                                             | The database username of the database to which you are importing system tables                                   |
|                    | <code>password</code>                                                                                                                                                                                    | Password for the <code>import_username</code>                                                                    |
|                    | <code>TNSname</code>                                                                                                                                                                                     | Name specified in <code>tnsnames.ora</code> for the database to which you are importing the system tables        |
| <b>Examples</b>    | To run:<br><br><code>arcsight import_system_tables &lt;old_arcsight_user&gt;<br/>&lt;new_arcsight_user&gt; &lt;password&gt; &lt;db_instance&gt;<br/>&lt;dump_file_path&gt; &lt;dump_file_name&gt;</code> |                                                                                                                  |

## keytool

|                    |                                                                               |                                                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Runs Java Runtime Environment keytool utility to manage key stores            |                                                                                                                                                                           |
| <b>Applies to</b>  | Manager, Console, SmartConnectors                                             |                                                                                                                                                                           |
| <b>Syntax</b>      | <code>keytool -store name</code>                                              |                                                                                                                                                                           |
| <b>Options</b>     | <code>-store name</code>                                                      | <b>(Required)</b> Specific store { managerkeys   managercerts   clientkeys   clientcerts   ldapkeys   ldapcerts   webkeys   webcerts }                                    |
|                    | <code>-help</code>                                                            | <b>(original options)</b> All options supported by the JRE keytool utility are passed along. Use arcsight keytool<br>For a list of help topics, or see Java documentation |
| <b>Examples</b>    | To view Console key store:<br><code>arcsight keytool -store clientkeys</code> |                                                                                                                                                                           |

## keytoolgui

|                    |                                                                            |  |
|--------------------|----------------------------------------------------------------------------|--|
| <b>Description</b> | Graphical user interface tool for manipulating key stores and certificates |  |
| <b>Applies to</b>  | Manager, Console                                                           |  |
| <b>Syntax</b>      | <code>keytoolgui</code>                                                    |  |
| <b>Options</b>     | None                                                                       |  |
| <b>Examples</b>    | To run:<br><code>arcsight keytoolgui</code>                                |  |

## kickbleep

|                    |                                                          |                                                               |
|--------------------|----------------------------------------------------------|---------------------------------------------------------------|
| <b>Description</b> | Runs a simple, standardized test using the bleep utility |                                                               |
| <b>Applies to</b>  | Manager                                                  |                                                               |
| <b>Syntax</b>      | <code>kickbleep</code>                                   |                                                               |
| <b>Options</b>     | <code>-f</code>                                          | Properties file (silent mode)                                 |
|                    | <code>-g</code>                                          | Generate sample properties file                               |
|                    | <code>-i</code>                                          | Mode: { swing, console, recorderui, silent}<br>Default: swing |
| <b>Examples</b>    | To run:<br><code>arcsight kickbleep</code>               |                                                               |

## listsubjectdns

|                    |                                                                                                 |                                                                                                                        |
|--------------------|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Display subject distinguished names (DN) from a key store                                       |                                                                                                                        |
| <b>Applies to</b>  | Manager, SmartConnectors                                                                        |                                                                                                                        |
| <b>Syntax</b>      | <code>listsubjectdns</code>                                                                     |                                                                                                                        |
| <b>Options</b>     | <code>-store name</code>                                                                        | Specific store { managerkeys   managercerts   clientkeys   clientcerts   ldapkeys   ldapcerts } (Default: clientkeys.) |
| <b>Examples</b>    | <p>To list Distinguished Names in the Console key store:</p> <pre>arcsight listsubjectdns</pre> |                                                                                                                        |

## logfu

|                    |                                                                                           |                                                                                                |
|--------------------|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>Description</b> | Graphical tool for analyzing log files.                                                   |                                                                                                |
| <b>Applies to</b>  | Manager (See also agent logfu.)                                                           |                                                                                                |
| <b>Syntax</b>      | <code>logfu {-a   -c   -m} [options]</code>                                               |                                                                                                |
| <b>Options</b>     | <code>-a</code>                                                                           | Analyze SmartConnector logs                                                                    |
|                    | <code>-c</code>                                                                           | Analyze Console logs                                                                           |
|                    | <code>-f timestamp</code>                                                                 | From time                                                                                      |
|                    | <code>-i</code>                                                                           | Display information about the log files that will be analyzed                                  |
|                    | <code>-l timespec</code>                                                                  | Analyze only the specified time (Format: <time>{smhd}) Examples: 1d = one day, 4h = four hours |
|                    | <code>-m</code>                                                                           | Analyze Manager logs                                                                           |
|                    | <code>-mempercent n</code>                                                                | Percent of memory messages to consider for plotting. (Default: 100)                            |
|                    | <code>-noex</code>                                                                        | Skip exception processing                                                                      |
|                    | <code>-noplot</code>                                                                      | Skip the plotting                                                                              |
|                    | <code>-t timestamp</code>                                                                 | To time                                                                                        |
| <b>Examples</b>    | <p>To analyze Manager logs for the last 12 hours:</p> <pre>arcsight logfu -m -l 12h</pre> |                                                                                                |

## managerinventory

|                    |                                                               |

|                    | <code>-o op</code>                                       | Operation {list, show}. Default is list                               |
|                    | <code>-out file</code>                                   | Output filename for management service information. Default is stdout |
|                    | <code>-p pwd</code>                                      | Password                                                              |
|                    | <code>-sanitize</code>                                   | Sanitize IP address and host names (Default: false)                   |
|                    | <code>-u name</code>                                     | User name                                                             |
| <b>Examples</b>    | To run:<br><code>arcsight monitor</code>                 |                                                                       |

## netio

|                    |                                                  |                                       |
|--------------------|--------------------------------------------------|---------------------------------------|
| <b>Description</b> | Primitive network throughput measurement utility |                                       |
| <b>Applies to</b>  | Manager                                          |                                       |
| <b>Syntax</b>      | <code>netio</code>                               |                                       |
| <b>Options</b>     | <code>-c</code>                                  | Client mode (Default: false)          |
|                    | <code>-n host</code>                             | Host to connect to (Client mode only) |
|                    | <code>-p port</code>                             | Port (Default: 9999)                  |
|                    | <code>-s</code>                                  | Server mode                           |

---

**Examples**

To run:

```
arcsight netio
```

---

## package

|                    |                                                                                                            |                                                                                                                                                                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | Import or export resources (users, rules, and so on) to or from one or more XML files.                     |                                                                                                                                                                                                                                                                                          |
| <b>Description</b> | Use this command instead of the archive command.                                                           |                                                                                                                                                                                                                                                                                          |
|                    | <b>Note:</b> Some functionality for this command are available from the GUI only                           |                                                                                                                                                                                                                                                                                          |
| <b>Applies to</b>  | Manager, Database, Console                                                                                 |                                                                                                                                                                                                                                                                                          |
| <b>Syntax</b>      | <pre>package -action &lt;action-to-be-taken&gt; -package &lt;package URI&gt; -f &lt;package-file&gt;</pre> |                                                                                                                                                                                                                                                                                          |
| <b>Options</b>     | - action action                                                                                            | Creates a new package based upon one or more packages that you specify. The possible actions include <code>bundle</code> , <code>convertarchives</code> , <code>export</code> , <code>import</code> , <code>install</code> , <code>uninstall</code> . The default is <code>export</code> |
|                    | -config config file                                                                                        | The primary configuration file to use. Default is <code>config/server.defaults.properties</code>                                                                                                                                                                                         |
|                    | -convertbaseuri baseuri                                                                                    | The base URI for packages that are converted from archives. This option is only used in conjunction with the <code>-action convertarchives</code> option                                                                                                                                 |
|                    | -f packagefile-location                                                                                    | The location of the package bundle file. File name paths can be absolute or relative. Relative paths are relative to <code>&lt;ARCSIGHT_HOME&gt;</code>                                                                                                                                  |
|                    | -m manager                                                                                                 | The Arcsight Manager to communicate with                                                                                                                                                                                                                                                 |
|                    | -password password                                                                                         | <b>(Optional)</b> The password with which to log in to the Manager                                                                                                                                                                                                                       |
|                    | -package packagerefs                                                                                       | The URI(s) of the package(s). This option is used in conjunction with <code>-action install</code> and <code>-action uninstall</code> in order to list which packages to operate upon                                                                                                    |
|                    | -pc privateConfig                                                                                          | This configuration file will override the <code>server.defaults.properties</code> file. The default location is <code>config/server.properties</code>                                                                                                                                    |
|                    | -pkcs11                                                                                                    | Use this option when authenticating with a PKCS#11 provider. For example,<br><br><pre>arcsight package -m &lt;hostname&gt; -pkcs11 -f &lt;file path&gt;</pre>                                                                                                                            |
|                    | -port port                                                                                                 | The port to use for communication. The default port used is 8443                                                                                                                                                                                                                         |
|                    | -source sourcefile                                                                                         | The source file. This is used in conjunction with the <code>-f</code> command which specifies an output file                                                                                                                                                                             |
|                    | -u username                                                                                                | The user name used for logging in to the Manager                                                                                                                                                                                                                                         |

---

|                          |                                                  |
|--------------------------|--------------------------------------------------|
| <code>-standalone</code> | Operate directly on the Database not the Manager |
|--------------------------|--------------------------------------------------|

---

To convert a previously archived package:

```
arcsight package -action convertarchives -convertbaseuri
"/All Packages/Personal/Mypackage" -source sourcefile.xml
-f packagebundle.arb
```

To install a package:

```
arcsight package -action install -package "/All
Packages/Personal/Mypackage" -u username -p password -m
managename
```

To uninstall a package:

```
arcsight package -action uninstall-package "/All
Packages/Personal/Mypackage" -standalone -config
/config/server.defaults.properties -pc
/config/server.properties
```

To import a package through the Manager:

```
arcsight package -action import -f packagebundle.arb -u
username -p password -m managename
```

To export a package:

### Examples

```
arcsight package -action export -package "/All
Packages/Personal/Mypackage" -f packagebundle.arb -u
username -p password -m managename
```

To export multiple packages:

```
arcsight package -action export -package "/All
Packages/Personal/PackageOne" -package "/All
Packages/Personal/PackageTwo" -f packagebundle.arb -u
username -p password -m managename
```

To export packages in a standalone mode (directly from the database) Make sure that the ArcSight Manager is not running:

```
arcsight package -action export -package "/All
Packages/Personal/Mypackage" -f packagebundle.arb -u
username -p password -standalone -config
server.default.properties -pc server.properties
```

To combine xml files from multiple packages into one package:

```
arcsight package -action bundle -f myPkgNew.arb -source
chnpkg.xml -source filterpkg.xml -source rulepkg.xml
```

In the above example, `chnpkg.xml`, `filterpkg.xml`, and `rulepkg.xml` files are extracted from their respective packages and will be bundled in one package bundle called `myPkgNew.arb`.

## portinfo

|                    |                                                                                                          |             |
|--------------------|----------------------------------------------------------------------------------------------------------|-------------|
| <b>Description</b> | Script used by the portinfo tool of the Console. Displays common port usage information for a given port |             |
| <b>Applies to</b>  | Console                                                                                                  |             |
| <b>Syntax</b>      | <code>portinfo port</code>                                                                               |             |
| <b>Options</b>     | <code>port</code>                                                                                        | Port number |
| <b>Examples</b>    | To run:<br><code>arcsight portinfo</code>                                                                |             |

## reenableuser

|                    |                                                                                       |                                            |
|--------------------|---------------------------------------------------------------------------------------|--------------------------------------------|
| <b>Description</b> | Re-enable a disabled user account                                                     |                                            |
| <b>Applies to</b>  | Manager                                                                               |                                            |
| <b>Syntax</b>      | <code>reenableuser username</code>                                                    |                                            |
| <b>Options</b>     | <code>username</code>                                                                 | The name of the user resource to re-enable |
| <b>Examples</b>    | To re-enable a disabled user:<br><code>arcsight reenableruser &lt;username&gt;</code> |                                            |

## refcheck

|                    |                                           |  |
|--------------------|-------------------------------------------|--|
| <b>Description</b> | Resource reference checker                |  |
| <b>Applies to</b>  | Manager                                   |  |
| <b>Syntax</b>      | <code>refcheck</code>                     |  |
| <b>Options</b>     | None                                      |  |
| <b>Examples</b>    | To run:<br><code>arcsight refcheck</code> |  |

## regex

|                    |                                               |  |
|--------------------|-----------------------------------------------|--|
| <b>Description</b> | Graphical tool for regex-based FlexConnectors |  |
| <b>Applies to</b>  | SmartConnectors                               |  |
| <b>Syntax</b>      | <code>regex</code>                            |  |
| <b>Options</b>     | None                                          |  |

|                 |                             |
|-----------------|-----------------------------|
| <b>Examples</b> | To run:                     |
|                 | <code>arcsight regex</code> |

## replayfilegen

|                    |                                                                                                                                                                                                                                                                                                      |                                                                 |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| <b>Description</b> | <p>Wizard for creating security event data files (“replay files”) that can be run against a Manager for testing, analysis, or demonstration purposes.</p> <p><b>Note:</b> This is a client side command only and should be executed from the Console’s <code>ARCSIGHT_HOME/bin</code> directory.</p> |                                                                 |
| <b>Applies to</b>  | Console                                                                                                                                                                                                                                                                                              |                                                                 |
| <b>Syntax</b>      | <code>replayfilegen -m mgr [options]</code>                                                                                                                                                                                                                                                          |                                                                 |
| <b>Options</b>     | <code>-f file</code>                                                                                                                                                                                                                                                                                 | Log file name (properties file in <code>-i</code> silent mode)  |
|                    | <code>-g</code>                                                                                                                                                                                                                                                                                      | Generate sample properties file for <code>-i</code> silent mode |
|                    | <code>-i mode</code>                                                                                                                                                                                                                                                                                 | Mode: console, silent, recorderui, swing                        |
| <b>Examples</b>    | Run from the Console’s <code>&lt;ARCSIGHT_HOME&gt;/bin</code> directory:                                                                                                                                                                                                                             |                                                                 |
|                    | <code>arcsight replayfilegen</code>                                                                                                                                                                                                                                                                  |                                                                 |
|                    | To run in console mode:                                                                                                                                                                                                                                                                              |                                                                 |
|                    | <code>arcsight replayfilegen -i console</code>                                                                                                                                                                                                                                                       |                                                                 |

## resetpwd

|                    |                                                                                                |                                                                 |
|--------------------|------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| <b>Description</b> | Wizard to reset a user’s password and optionally notify the user of the new password by e-mail |                                                                 |
| <b>Applies to</b>  | Manager                                                                                        |                                                                 |
| <b>Syntax</b>      | <code>resetpwd</code>                                                                          |                                                                 |
| <b>Options</b>     | <code>-f file</code>                                                                           | Log file name (properties file in <code>-i</code> silent mode)  |
|                    | <code>-g</code>                                                                                | Generate sample properties file for <code>-i</code> silent mode |
|                    | <code>-i mode</code>                                                                           | Mode: console, silent, recorderui, swing                        |
|                    | <code>-h</code>                                                                                | Display command help                                            |
| <b>Examples</b>    | To reset a user’s password:                                                                    |                                                                 |
|                    | <code>arcsight resetpwd</code>                                                                 |                                                                 |

## restorearchives

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>This tool allows you to load archives from an older ArcSight Express installation to a new one. The loaded archives from the older installation are loaded as archives in DEACTIVATED state. By activating them, you can load the events and search through them as you would for an archive that was done from the newer installation. The system does not differentiate between the archives loaded from a different installation and the ones created daily locally.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p><code>-C clear</code>      Clears all events and archives from the database, and then load the archives. This is required when the events loaded from a different ArcSight Express appliance clashes with the events present in the local appliance. This is useful when the tool skips some archives because of event ID clash, or archive clash. This tool will remove all events and archives from the local installation. Therefore, this option is most useful for a fresh ArcSight Express installation.</p> |

| <code>-v &lt;certificate_validity_in_months&gt;</code> | Set the number of months a new certificate will be valid. You can use this option with the <code>-w</code> option which will set the beginning time for the certificate validity. If you do not use the <code>-w</code> option, the validity period begins at the current system time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                 |                                   |                 |                                                                        |                                                        |                                                                                                                                                                                                                                                                                        |                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                          |                                                                                                                                                                                                                                                                                                                                       |                                          |                                      |                                                  |                                       |                 |                            |                 |                           |                 |               |
| <code>-w &lt;beginning_offset_months&gt;</code>        | <p>If you do not specify the <code>-v</code> argument, the default validity period of the certificate is three months.</p> <p>Set an offset from the current system time, in months, for the beginning of a certificate's validity period. Can be used when creating the certificate. Use a minus sign (-) to indicate a negative offset. If this argument is not used, the validity period begins at the current system time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                 |                                   |                 |                                                                        |                                                        |                                                                                                                                                                                                                                                                                        |                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                          |                                                                                                                                                                                                                                                                                                                                       |                                          |                                      |                                                  |                                       |                 |                            |                 |                           |                 |               |

| <b>Description</b> | <p>Utility that creates or updates the search index for resources in ArcSight Database.</p> <p>If you provide the credentials for the Manager, it automatically associates with the newly created or updated index. However, if you do not specify any credentials, you will have to manually configure the Manager to use the updated index.</p> <p><b>Note:</b> Supporting 50,000 actors will require a minimum of 2 GB heap size for this service. The value of the heap size needs to be modified in <code>&lt;ARCSIGHT_HOME&gt;/bin/scripts/searchindex.bat</code> and <code>&lt;ARCSIGHT_HOME&gt;/bin/scripts/searchindex.sh</code> files. The default value in these files is set to 1028m.</p>                                                                                                                                                                                                     |
| <b>Applies to</b>  | Manager, Database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Syntax</b>      | <code>searchindex -a action</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>     | <p><code>-a action</code> Possible actions: <code>create</code>, <code>update</code>, or <code>regularupdate</code></p> <p><code>create</code>—Creates a new search index.</p> <p><code>update</code>—Updates all resources in the index that were touched since the last daily update was run. Although “update” is a scheduled task that runs daily, you can run it manually.</p> <p><code>regularupdate</code>—Updates all resources in the index that were touched since the last regular update was run. Although “regular update” is a scheduled task that runs every 5 minutes, you can run it manually.</p> <p><code>-m manager</code> Name of the Manager</p> <p><code>-p password</code> Password for the user</p> <p><code>-t time</code> Time stamp that indicates starting when the resources should be updated</p> <p><code>-u user</code> User name with which to log in to the Manager</p> |
| <b>Examples</b>    | <p>To run:</p> <p><code>arcsight searchindex -a action</code></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## sendlogs

|                    |                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Wizard to sanitize and send ArcSight log files to ArcSight for analysis. (This utility replaces the old ‘ <code>packlogs</code> ’ tool.) |
| <b>Applies to</b>  | Manager, Database, Console, SmartConnectors                                                                                              |
| <b>Syntax</b>      | <code>sendlogs</code>                                                                                                                    |

|                 |                                                  |                                                                                                 |
|-----------------|--------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <b>Options</b>  | <code>-f file</code>                             | Log file name (properties file in <code>-i</code> silent mode)                                  |
|                 | <code>-g</code>                                  | Generate sample properties file for <code>-i</code> silent mode                                 |
|                 | <code>-i mode</code>                             | Mode: <code>console</code> , <code>silent</code> , <code>recorderui</code> , <code>swing</code> |
|                 | <code>-n num</code>                              | Incident number (Quick mode)                                                                    |
| <b>Examples</b> | To run on all components except SmartConnectors: |                                                                                                 |
|                 | <code>arcsight sendlogs</code>                   |                                                                                                 |
|                 | To run on SmartConnectors:                       |                                                                                                 |
|                 | <code>arcsight agent sendlogs</code>             |                                                                                                 |

## tee

|                    |                                                                                  |                             |
|--------------------|----------------------------------------------------------------------------------|-----------------------------|
| <b>Description</b> | Displays the output of a program and simultaneously writes that output to a file |                             |
| <b>Applies to</b>  | Manager                                                                          |                             |
| <b>Syntax</b>      | <code>-f filename</code>                                                         |                             |
| <b>Options</b>     | <code>-a</code>                                                                  | Append to the existing file |
| <b>Examples</b>    | To run:<br><code>arcsight tempca -i   arcsight tee sslinfo.txt</code>            |                             |

## tempca

|                    |                                      |                                                                                                          |
|--------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Inspect and manage demo certificates |                                                                                                          |
| <b>Applies to</b>  | Console                              |                                                                                                          |
| <b>Syntax</b>      | <code>tempca</code>                  |                                                                                                          |
| <b>Options</b>     | <code>-a alias</code>                | Key store alias of the private key to dump                                                               |
|                    | <code>-ac</code>                     | Add the demo CA's certificate to the client truststore                                                   |
|                    | <code>-ap</code>                     | Create demo SSL key pair and add it to ArcSight Manager key store                                        |
|                    | <code>-dc</code>                     | Dump/export the demo CA's certificate to a file ( <code>demo.crt</code> ) for browser import             |
|                    | <code>-dpriv</code>                  | Dump private key from ArcSight Manager key store                                                         |
|                    | <code>-f file</code>                 | Filename to write the demo CA's certificate to                                                           |
|                    | <code>-i</code>                      | Display summary of current SSL settings                                                                  |
|                    | <code>-k n</code>                    | Key store: Manager (1) or Web Server (2)                                                                 |
|                    | <code>-n host</code>                 | Host name of the Manager (opt for the creation of a demo key pair)                                       |
|                    | <code>-nc</code>                     | No chain: Do not include certificate chain (option for creation of a demo key pair)                      |
|                    | <code>-rc</code>                     | Reconfigure not to trust demo certificates. Removes the demo CA's certificate from the client truststore |
|                    | <code>-rp</code>                     | Remove pair's current key pair from ArcSight Manager key store                                           |
|                    | <code>-v d</code>                    | Validity of the new demo certificate in days (Default: 365)                                              |

|                 |                              |
|-----------------|------------------------------|
| <b>Examples</b> | To run:                      |
|                 | <code>arcsight tempca</code> |

## threaddumps

|                    |                                                                     |  |
|--------------------|---------------------------------------------------------------------|--|
| <b>Description</b> | Utility to extract and reformat thread dumps from Manager log files |  |
| <b>Applies to</b>  | Manager                                                             |  |
| <b>Syntax</b>      | <code>threaddumps [file]</code>                                     |  |
| <b>Options</b>     | None                                                                |  |
| <b>Examples</b>    | To run:                                                             |  |
|                    | <code>arcsight threaddumps</code>                                   |  |

## tproc

|                    |                                        |                      |
|--------------------|----------------------------------------|----------------------|
| <b>Description</b> | Standalone Velocity template processor |                      |
| <b>Applies to</b>  | Manager                                |                      |
| <b>Syntax</b>      | <code>tproc</code>                     |                      |
| <b>Options</b>     | <code>-d file</code>                   | Definitions file     |
|                    | <code>-Dname=value</code>              | Defines              |
|                    | <code>-h</code>                        | Display command help |
|                    | <code>-l</code>                        | Keep log file        |
|                    | <code>-o file</code>                   | Output file          |
|                    | <code>-p file</code>                   | Properties file      |
|                    | <code>-t file</code>                   | Template file        |
|                    | <code>-v</code>                        | Verbose mode         |
| <b>Examples</b>    | To run:                                |                      |
|                    | <code>arcsight tproc</code>            |                      |

## webserversetup

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <b>Description</b> | See <a href="#">runwebsetup</a> and <a href="#">websetup</a> |
| <b>Applies to</b>  | ArcSight Web                                                 |

## websetup

|                    |                                                                                    |
|--------------------|------------------------------------------------------------------------------------|
| <b>Description</b> | Run the ArcSight Web Configuration Wizard                                          |
| <b>Applies to</b>  | ArcSight Web                                                                       |
| <b>Syntax</b>      | <a href="#">websetup</a>                                                           |
| <b>Options</b>     | None                                                                               |
| <b>Examples</b>    | To run the ArcSight Web Configuration Wizard:<br><a href="#">arcsight websetup</a> |

## whois

|                    |                                                                 |                                   |
|--------------------|-----------------------------------------------------------------|-----------------------------------|
| <b>Description</b> | Script used by the <a href="#">whois</a> command of the console |                                   |
| <b>Applies to</b>  | Console                                                         |                                   |
| <b>Syntax</b>      | <a href="#">whois</a> [-p port] [-s host] target                |                                   |
| <b>Options</b>     | <a href="#">-p port</a>                                         | Server port                       |
|                    | <a href="#">-s host</a>                                         | Name or address of 'whois' server |
|                    | <a href="#">target</a>                                          | Name or address to lookup         |
| <b>Examples</b>    | To run:<br><a href="#">arcsight whois</a>                       |                                   |

## Appendix B

# Troubleshooting

---

The following information may help solve problems that occur while operating the ArcSight system. In some cases, the solution can be found here or in specific ArcSight documentation, but ArcSight Customer Support is available if you need it.

If you intend to have ArcSight Customer Support guide you through a diagnostic process, please prepare to provide specific symptoms and configuration information. If you intend to do the initial diagnostic steps yourself, proceed through the following checklist systematically, trying each applicable item and noting the results for reference.

This appendix is divided into the following sections:

[“General” on page 129](#)  
[“Query and Trend Performance Tuning” on page 131](#)  
[“SmartConnectors” on page 133](#)  
[“Console” on page 134](#)  
[“Manager” on page 135](#)  
[“ArcSight Web” on page 136](#)  
[“SSL” on page 136](#)

## General

### Report is empty or missing information.

Check that the user running the report has inspect (read) permission for the data being reported.

### Running a large report crashes the Manager.

A very large report (for example, a 500 MB PDF report) might require so much virtual machine (VM) memory that it can cause the ArcSight Manager to crash and restart. To prevent this scenario, you can set up the Manager to expose a special report parameter for generating the report in a separate process. The separate process has its own VM and heap, so the report is more likely to generate successfully. Even if the memory allocated is still not enough, the report failure will not crash the Manager.

This option must be set up on the Manager to expose it in the Console report parameters list. The steps are as follows:

- 1 On the ArcSight Manager in the `server.properties` file, set `report.canarchiveinseparateprocess=true`. (This will make a new report parameter available on the Console.)
- 2 Save the `server.properties` file and restart the Manager.
- 3 On the ArcSight ESM Console, open the report that you want to run in a separate process in the Report Editor, and click the **Parameters** tab. Set the parameter **Generate Report In Separate Process** to `true`.
- 4 Run the report. The report should run like a normal report, but it will not consume the resources of the Manager VM.

Use this parameter only if you experience a Manager crash when running large reports such as the ones that contain tables with more than 500,000 rows and 4 or 5 columns per row.

---

## Some Asian language fonts appear mangled when generating reports in PDF

This problem occurs because some Asian language fonts that are truetype fonts are not supported directly by versions of Adobe Reader earlier than version 8.0. In order to work around this, each truetype font must be mapped to an opentype font supported in Adobe Reader 8.0. ArcSight provides this mapping in the `<ARCSIGHT_HOME>/il8n/server/reportpdf_config_<locale>.properties` file. You have the option to change the default mapping of any truetype font to the opentype font by modifying the respective font mapping in this file.

To work around the issue of mangled fonts, ArcSight recommends that you:

- 1 Install a localized Adobe Reader 8.0 depending on the language of your platform on your Manager machine. This version of the Adobe Reader installs the opentype fonts by default.
- 2 Edit the `server.properties` file as follows:
  - a Set `report.font.truetype.path` property to point to the directory that contains the truetype and opentype font. The path is typically `/usr/lib/font`. The CIDFont directory is `/usr/lib/font:<adobe_reader_dir>/Resource/CIDFont`.
  - b Set `report.font.cmap.path` property to point to Adobe Reader's CMap directory. The CMap path is relative to the Adobe Reader installation -- `<adobe_reader_dir>/Resource/CMap`.

## E-mail notification doesn't happen.

If you receive the following error:

```
[2009-12-03 14:31:33,890][WARN
][default.com.arcsight.notification.NotifierBase][send] Unable to
send out e-mail notification, notifications have not been
configured.
```

- Verify the following properties are set in the `server.properties` file:

```
notifications.enable=true
```

and

```
notifications.incoming.enable=true
```

- Check `server.properties` file to find which SMTP server is associated with the Manager. Make sure that the SMTP server is up and running.  
Review the Notification resource and confirm the e-mail address and other configuration settings.

## Notification always escalates.

Check `server.properties` file to find which POP3 or IMAP server is associated with the Manager. Make sure that the POP3 or IMAP server is up and running, in order to process acknowledgements from notification recipients.

## Pager notification doesn't happen.

Check `server.properties` file to find which SNPP server is associated with the Manager. Make sure that the SNPP server is up and running.

## Query and Trend Performance Tuning

Previous to ESM v.4.0 SP1, some trends exceeded 10 hours to execute queries. This eventually caused these queries to fail or lead to ESM scheduler problems. This effect was most pronounced on systems with high event rates (typically thousands of events per second).

To resolve this issue, various queries used by the trends in the default ArcSight system content were studied to ensure that the database was choosing optimal query execution plans. In a number of cases, the execution plan was not optimal and database "hints" were added to the queries to optimize the query execution. Most of these queries were sped up, some of them by a significant amount (much more than a factor of 10).

We have enhanced the scheduler to allocate two threads for processing system tasks. This change alleviates performance issues caused by conflicts between system tasks and user level tasks within the scheduler.

Starting in ESM v.4.0 SP1, Patch 3, several performance enhancements related to queries and trends were included. All follow-on service packs, patches, and releases include these performance enhancements, configurable properties, and reports. The following sections detail these, and also provide other troubleshooting tips.

### server.defaults.properties Entries for Trends

- `trends.query.timeout.seconds=7200`  
This is the amount of time that a trend query is allowed to run, in seconds, before the SQL statement times out and the trend query fails. If absent or 0, no time-based timeout is applied.
- `trends.query.timeout.percent=50`  
This is the amount of time that a trend query is allowed to run, as a percentage of the query interval for interval trends, before the SQL statement times out and the trend query fails. If absent or 0, no percentage-based timeout is applied.  
  
As an example, with a 50 percent setting, a query covering a start/end time range of 1 hour will time out after 30 minutes. A start/end time range covering 1 day would time out after 12 hours.

If both timeouts are specified, the system will use the smaller of the two.

- `trends.query.failures.deactivation.threshold=3`

If this many consecutive "accumulate" (not refresh) runs fail for any reason, the system automatically disables the trend. The check is always performed after any accumulate query run fails. Once the threshold is reached, any remaining queries to be executed by this task are skipped. If this setting is absent or 0, the checking mechanism is turned off.

If a trend or query is stopped because of any of the above reasons, an audit event will reflect this.

## Troubleshooting Checklist after Restarting the Manager

- Use the Console Trend Editor to manually disable any trends that you do not need or that you notice have excessive query times. Disabling these trends will help reduce scheduler and database contention.
- As trend data gathering tasks wake up, the trend will attempt to fill in the gaps for missing intervals. Depending on the size of the gaps, this may take some time before the trends catch up.
- A trend will not usually re-run any previously failed runs. If you want to re-run a particular time, you need to manually request it from the Trend Editor.

## Reports for Monitoring Trend Performance

The following new reports are available as a part of this Patch. We recommend running these reports after installing the Patch to monitor the trend performance:

`/All Reports/ArcSight Administration/Resource  
Monitoring/Trends/Trend Query Runs Duration`

`/All Reports/ArcSight Administration/Resource  
Monitoring/Trends/Skipped Scheduled Tasks`

## Disable these Trends on High Throughput Systems

If your system environment typically processes a very large number of events per second (EPS) (e.g., over 1000 EPS or 100 million events per day), we recommend that you manually disable the following 9 trends, which are enabled by default:

`/All Trends/ArcSight Administration/User/ArcSight User Login Trends  
- Hourly`

`/All Trends/ArcSight Foundation/Configuration Monitoring/Asset  
Configuration Change Tracking/Host Configuration Modifications`

`/All Trends/ArcSight Foundation/Configuration Monitoring/Asset  
Restarts/Asset Startup and Shutdown Events - Daily Trend`

`/All Trends/ArcSight Foundation/Configuration Monitoring/User  
Account Modifications/User Account Creation`

`/All Trends/ArcSight Foundation/Configuration Monitoring/User  
Account Modifications/User Account Modifications`

`/All Trends/ArcSight Foundation/Intrusion Monitoring/Operational  
Summaries/Reconnaissance/Port Scanning`

[/All Trends/ArcSight Foundation/Intrusion Monitoring/Operational Summaries/Reconnaissance/Zone Scanning Events by Priority](#)

[/All Trends/ArcSight Foundation/Intrusion Monitoring/Operational Summaries/Vulnerability View/Prioritized Vulnerability Events by Zone](#)

[/All Trends/ArcSight Foundation/Network Monitoring/Overall Traffic](#)

## How will you know when a trend is caught up?

You can use either of the following techniques, both using the ESM Console UI:

- Using the Trend Data Viewer from within the Trends resource tree, you can see at most 2000 rows of data. (Select a trend in the resource tree, right-click, and choose **Data Viewer**.) Sort the trend timestamp column so that the timestamps show newest to oldest and observe when the newest value indicates it has caught up.
- Using the **Refresh...** button in the Trend Editor, set the start time as far back as needed (days or weeks) to see any entries and click Refresh to see which runs show up as available to be refreshed. Only the most recent ones should show first. Note that you should not actually refresh any runs, but only use this technique to see what has been run.

## How long will it take a trend to catch up?

This depends on how long the underlying query interval is, but a trend will typically do up to 48 runs, as needed, when it wakes up.

For a trend that queries an entire day and runs once a day, this would allow for more than a month's worth of data to be queried. The data must be present on the system, however, or the query will return no results (but it will not fail).

## SmartConnectors

### My device is not one of the listed SmartConnectors.

ArcSight offers an optional feature called the FlexConnector Development Kit which may enable you to create a custom SmartConnector for your device.

ArcSight can create a custom SmartConnector. Contact ArcSight Customer Support.

### My device is on the list of supported products, but it does not appear in the SmartConnector Configuration Wizard.

Your device is likely served by a Syslog sub-connector of either file, pipe, or daemon type.

### Device events are not handled as expected.

Check the SmartConnector configuration to make sure that the event filtering and aggregation setup is appropriate for your needs.

### SmartConnector not reporting all events.

Check that event filtering and aggregation setup is appropriate for your needs.

## Some Event fields are not showing up in the Console.

Check that the SmartConnector's Turbo Mode and the Turbo Mode of the Manager for the specific SmartConnector resource are compatible. If the Manager is set for a faster Turbo Mode than the SmartConnector, some event details will be lost.

## SmartConnector not reporting events.

Check the SmartConnector log for errors. If the SmartConnector cannot communicate with the Manager, it will cache events until its cache is full.

## Console

### Can't log in with any Console.

Check that the ArcSight Manager is up and running. If the Manager is not obviously running, run:

```
/sbin/service arcsight_services start manager
```

If the Manager is running, but you still can't log in, suspect any recent network changes, such as the installation of a firewall that will affect communication with the Manager host.

### Can't log in with a specific Console.

If you can log in from some Console machines but not others, focus on any recent network changes and any configuration changes on the Console host in question.

### Console reports out of memory.

This can happen when you open many independent viewing channels. If you need to do this often, change the memory settings in the `console.bat` or `console.sh` file. Find the line that starts set `ARCSIGHT_JVM_OPTIONS=` and change the parameter `-Xmx128m` to `-Xmx256m`. You must restart the Console for the new setting to take effect.

### Acknowledgement button is not enabled.

The Acknowledgement button is enabled when there are notifications to be acknowledged and they are associated with a destination that refers to the current user. To enable the button, add the current user to the notification destination.

### The grid view of Live security events is not visible.

To restore the standard grid view of current security events, select **Active Channels** from the Navigator drop-down menu. Double-click **Live**, found at `/Active channels/Shared/All Active channels/ArcSight System/Core/Live`

### The Navigator panel is not visible.

Press **Ctrl+1** to force the Navigator panel to appear.

### The Viewer panel is not visible.

Press **Ctrl+2** to force the Viewer panel to appear.

## The Inspect/Edit panel is not visible.

Press **Ctrl+3** to force the Inspect/Edit panel to appear.

## Internal ArcSight events appear.

Internal ArcSight events appear to warn users of situations such as low disk space for the Database. If you are not sure how to respond to a warning message, contact ArcSight Customer Support.

## The Manager Status Monitor reports an error.

The Console monitors the health of the ArcSight Manager and the Database. If a warning or an error occurs, the Console may present sufficient detail for you to solve the problem. If not, report the specific message to ArcSight Customer Support.

## Console logs out by itself.

Check the Console log file for any errors. Log in to the Console. If the Console logs out again, report the error to ArcSight Customer Support.

## Console stops responding when sending a test SNPP notification.

If the Console stops responding when sending a test SNPP notification, it may indicate that the SNPP port is blocked by a firewall or packet filtering device.

# Manager

## Can't start Manager.

The ArcSight Manager will provide information on the command console which may suggest a solution to the problem. Additional information will be written to

`<ARCSIGHT_HOME>/logs/default/server.std.log`.

To check database connectivity manually, open a command window on

`<ARCSIGHT_HOME>/bin` (on the Manager host) and run:

```
arcsight testdbconnection
```

## Manager shuts down.

The Manager stops when it encounters a fatal error. The file

`<ARCSIGHT_HOME>/logs/default/server.std.log` will have more details about the error condition.

## Scheduled Task Run is Off When Switching from Daylight Savings Time to Standard Time or Vice Versa.

- If the trigger time for a particular scheduled task run happens to fall during the transition time from DST to ST or vice versa, the interval for that particular run gets thrown off. The interval calculation for subsequent scheduled runs do not get affected.
- Currently, there are four time zones that are not supported in ESM:
  - ◆ Kwajalein

- ◆ Pacific/Kwajalein
- ◆ Pacific/Enderbury
- ◆ Pacific/Kiritimati

These time zones fall in two countries, Marshall Islands and Kiribati.

## ArcSight Web

### Some content, particularly dashboards, is not visible.

Install the latest Adobe Flash plug-in to your browser. Visit the Adobe website to download this free plug-in.

### Can't log in to ArcSight Web.

Check that the ArcSight Web Server is up and running. If ArcSight Web is up, check that the ArcSight Manager is also up and running.

If the Manager is running, but you still can't log in, suspect any recent network changes, such as the installation of a firewall that will affect communication between the ArcSight Web server and the Manager host.

If you can log in to the ArcSight Console but not ArcSight Web, focus on any recent network changes and any configuration changes to your browser.

Make sure that the version number of ArcSight Web matches that of the Manager. If the version numbers do not match, log in will be disabled.

### Can't start ArcSight Web.

If the ArcSight Web Server cannot start, check that the ArcSight Manager is up and running. If the Manager is not obviously running, run:

```
/sbin/service arcsight_services start manager
```

Examine the ArcSight Web log file for specific error messages. If the message is not clear, contact ArcSight Customer Support.

## SSL

### Cannot connect to the SSL server: IO Exception in the server logs when connecting to the server

#### Causes:

The SSL server may not be running.

- A firewall may be preventing connections to the server.

#### Resolutions:

- Ensure that the SSL server is running.
- Also, ensure that a firewall is not blocking connections to the server.

## Cannot connect to the SSL server

The hostname to which the client initiates an SSL connection should exactly match the hostname specified in the server SSL certificate that the server sends to the client during the SSL handshake.

### Causes:

- You may be specifying Fully Qualified Domain Name (FQDN) when only hostname is expected or the other way around.
- You may be specifying IP address when hostname is expected.

### Resolutions:

- Type exactly what the server reports on startup in `server.std.log` ("Accepting connections at http://...")
- For Network Address Translation (NAT) or multi-homed deployments, use hosts file to point client to correct IP.

## PKIX exchange failed/could not establish trust chain

### Cause:

Issuer cannot be found in trust store, the cacerts file.

### Resolution:

Import issuer's certificate (chain) into the trust store.

## Issuer certificate expired

### Cause:

The certificate that the SSL server is presenting to the client has expired.

### Resolution:

Import the latest issuer's certificate (chain) into the trust store.

## Cannot connect to the Manager: Exception in the server log

### Cause:

If you replaced the Manager's key store, it is likely that the old key store password does not match the new password.

### Resolution:

Make sure the password of the new key store matches the old key store. If you do not remember the current key store's password, run the Manager Configuration Wizard on the Manager (ArcSight Web Configuration Wizard on the Web) to set the password of the current key store to match the new key store's password.

## Certificate is invalid

### Cause:

The timestamp on the client machine might be out of the bounds of the validity range specified on the certificate.

### Resolution:

Make sure that the current time on the client machine is within the validity range on the certificate.

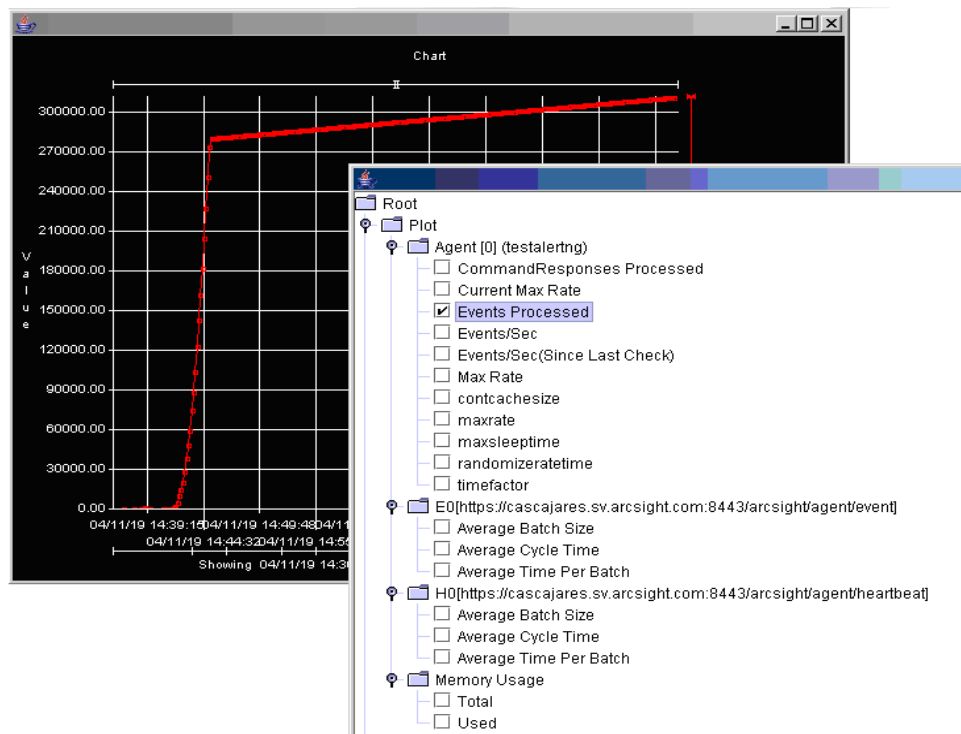

## Appendix C

# The Logfu Utility

This appendix is divided into the following sections:

- “Running Logfu” on page 140
- “Example” on page 142
- “Troubleshooting” on page 142
- “Menu” on page 144
- “Typical Data Attributes” on page 144
- “Intervals” on page 145

Logfu is an ArcSight utility that analyzes log files. It is indispensable for troubleshooting problems that would otherwise require poring over text logs. Logfu generates an HTML report ([logfu.html](#)) and, especially in SmartConnector mode, includes a powerful graphic view of time-based log data. Logfu pinpoints the time of the problem and often the cause as well.

**Figure C-1** Logfu has two windows: the interactive Chart and the Plot/Event window.

## Running Logfu

Logfu finds log files in the current directory. The `-a` or `-m` or `-c` switches tell it which file names to look for. The `-m` switch tells it to look for all three Manager logs—`server.std.log`, `server.log`, and `server.status.log`—for example.

To run Logfu, follow these steps:

- 1 Open a shell window in `<ARCSIGHT_HOME>/logs/default`. This refers to the logs directory under the ArcSight installation directory. Logfu requires an X Windows server.
- 2 Run logfu for the type of log you will analyze:

For Manager logs, run: `../bin/arcsight logfu -m`

For SmartConnector logs, run: `../bin/arcsight agent logfu -a`

- 3 Right-click in the grid and select **Show Plot/Event Window** from the context menu.
- 4 Check at least one attribute (such as Events Processed) to be displayed.

The initial display is always an empty grid. Loading very large log files can take a few minutes (a 100MB log might take 5 or 10 minutes). Once log files are scanned, the information gleaned from them is cached (in files named data.\*) that will speed up loading the second time. If something about the log changes, however, you must manually delete the cache files to force logfu to reprocess the log.

Right-click the grid and choose **Show Plot/Event Window** from the context menu. Select what to show on the grid from the **Plot/Event Window** that appears.

The tree of possible things to display is divided into Plot—attributes that can be plotted over time, like events per second—and Event—one-time things, like exceptions, which are shown as vertical lines. Check as many things as you want to show.

Because SmartConnectors can talk to multiple Managers and each can be configured to use multiple threads for events, the Plot hierarchy includes nodes for each SmartConnector and each Manager. Within the SmartConnector, threads are named E0, E1, and so on. Each SmartConnector has one heartbeat thread (H0) as well. Different types of SmartConnector

(firewall log SmartConnector, IDS SNMP SmartConnector, and so on) have different attributes to be plotted.

**Figure C-2** The interactive Chart uses sliders to change the view. Hovering over a data point displays detailed information.

There are two horizontal sliders—one at the top of the grid, one underneath. The slider at the top indicates the time scale. Drag it to the right to zoom in, or widen the distance between time intervals (vertical lines). The slider at the bottom changes the interval between lines—anywhere from 1 second at the far left to 1 day at the far right. The time shown in the grid is listed below the bottom slider:

Showing YY/MM/DD HH:MM:SS - YY/MM/DD HH:MM:SS (Interval= X)

Click anywhere in the grid area and drag a green rectangle to zoom in, changing both the vertical and horizontal scales at once. Hold the **Ctrl** key as you drag to pan the window in the vertical or horizontal direction, and hold both the **Shift** and **Ctrl** keys as you drag to constrain the pan to either vertical or horizontal movement. When you are panning, only sampled data is shown, but when you stop moving, the complete data will fill in. (You can change this by unchecking **Enable reduced data point rendering** in Preferences.)

Hover the mouse over a data point to see detailed information in a “tooltip” window, as shown in [Figure C-2](#).

For each attribute being plotted, a colored, vertical slider appears on the right of the grid. This slider adjusts the vertical (value) scale of the thing being plotted.

By default, data points are connected by lines. When data is missing, these lines can be misleading. To turn off lines, uncheck **Connect dots** in Preferences.

Once you have specified attributes of interest, scaled the values, centered and zoomed the display to show exactly the information of concern, select **Save as JPG** on the menu to create a snapshot of the grid display that you can print or e-mail. The size of the output image is the same as the grid window, so maximize the window to create a highly detailed snapshot, or reduce the window size to create a thumbnail.

## Example

Perhaps a particular SmartConnector starts by sending 10 events per second (EPS) to the Manager, but soon is sending 100, then 500, then 1000 EPS before dropping back down to 10. Logfu lets you plot the SmartConnector's EPS over time—the result is something like a mountain peak.

When you plot the Manager's receipt of these events, you might see that it keeps up with the SmartConnector until 450 EPS or so. You notice that the Manager continues consuming 450 EPS even as the SmartConnector's EPS falls off. This is because the Manager is consuming events that were automatically cached.

By plotting the estimated cache size, you can see the whole story—the SmartConnector experienced a peak event volume and the cache stepped in to make sure that the Manager didn't lose events, even when it couldn't physically keep up with the SmartConnector.

Use the vertical sliders on the right to give each attribute a different scale to keep the peak EPS from the SmartConnector from obscuring the plot of the Manager's EPS.

## Troubleshooting

Another real-world example involved a Check Point SmartConnector that was mysteriously down for almost seven days. Logfu plotted the event stream from the SmartConnector and it was clearly flat during the seven days, pinpointing the outage as well as the time that the event flow resumed. By overlaying Check Point Log Rotation events on the grid, it became clear that the event outage started with a Log Rotation and that event flow resumed coincident with a Log Rotation.

Further investigation revealed what had happened—the first Check Point Log Rotation failed due to lack of disk space, which shut down event flow from the device. When the disk space problem had been resolved, the customer completed the Log Rotation and event flow resumed.

If the Manager suddenly stops seeing events from a SmartConnector Logfu helps determine whether the SmartConnector is getting events from the device. Another common complaint is that not all events are getting through. Logfu has a plot attribute called 'ZFilter'—zone filter—that indicates how many raw device events are being filtered by

the SmartConnector. Events processed (the number of events sent by the device) minus ZFilter should equal Sent (the number of events sent to the Manager).

Logfu

# Appendix D

## Creating Custom E-mails Using Velocity Templates

---

This appendix describes how to modify Velocity templates to customize e-mail messages you receive from the ArcSight notification system.

This appendix is divided into the following sections:

[“Overview” on page 147](#)

[“Notification Velocity templates” on page 147](#)

A sample use case is presented to illustrate the concept.

### Overview

ArcSight supports the use of Velocity templates that are a means of specifying dynamic input to the underlying Java code.

You can apply Velocity templates in a number of places in ArcSight. For a complete list of Velocity template applications in ArcSight, see the Console online Help.

This section describes one such application—E-mail Notification Messages—in detail. You can use Velocity templates on your Manager to create custom e-mail messages to suit your needs.

### Notification Velocity templates

The `<ARCSIGHT_HOME>/Manager/config/notifications` directory contains the following two Velocity templates for customizing e-mail notifications:

- `Email.vm`—The primary template file that calls secondary template files.
- `Informative.vm`—The default secondary template file.

### Commonly used elements in Email.vm and Informative.vm files

It is important to understand the commonly used Velocity programming elements in the `Email.vm` and `Informative.vm` files before editing these files.

#### The #if statement

The general format of the #if statement for string comparison is:

```
#if ($introspector.getDisplayValue($event, ArcSight_Meta_Tag)
Comparative_Operator Compared_Value)
```

The #if statement for integer comparison is:

```
#if ($introspector.getValue($event,
ArcSight_Meta_Tag).intValue()Comparative_Operator Compared_Value)
```

You can specify `ArcSight_Meta_Tag`, `Comparative_Operator`, and `Compared_Value` to suit your needs.

`ArcSight_Meta_Tag` is a string when using the #if statement for string comparison (for example, `displayProduct`) and is an integer for the #if statement for integer comparison (for example, `severity`).

For a complete listing of ArcSight meta tags, see the Token Mappings topic in ArcSight FlexConnector Guide.

`Comparative_Operator` is `==` for string comparison; `=`, `>`, and `<` for integer comparison.

`Compared_Value` is a string or an integer. For string comparison, enclose the value in double quotes (" ").

## Contents of Email.vm and Informative.vm

The default `Email.vm` template file contents are:

```
## This is a velocity macro file...

## The following fields are defined in the velocity macro.

## event == the event which needs to be sent.

## EVENT_URL == root of the event alert.

## NOTIFICATION_URL == URL of the notifications page in ArcSight
Web

#parse ("Informative.vm")
```

This message can be acknowledged in any of the following ways:

- 1) Reply to this email. Make sure that the notification ID listed in this message is present in your reply)
- 2) Login to the ArcSight Console and click on the notification button on the status bar
- 3) Login to ArcSight Web at `${NOTIFICATION_URL}`

To view the full alert please go to at `${EVENT_URL}`

The default `Informative.vm` template file contents are:

```
=== Event Details ===

#foreach( $field in $introspector.fields )

#if( $introspector.getDisplayValue($event, $field).length() > 0 )
```

```

${field.fieldDisplayName}: $introspector.getDisplayValue($event,
$field)

#end

#end

```

## How the Email.vm and Informative.vm Template Files Work

Email.vm calls the secondary template file Informative.vm (#parse ("Informative.vm")). The Informative.vm file lists all the non-empty fields of an event in the format fieldName : fieldValue.

## Understanding the Customization Process

If you want to customize the template files to suit your needs, ArcSight recommends that you create new secondary templates containing fields that provide information you want to see in an e-mail for a specific condition.

For example, if you want to see complete details for an event—Threat Details, Source Details, Target Details, and any other information—generated by all Snort devices in your network, create a secondary template file called Snort.vm in <ARCSIGHT\_HOME>/config/notification, on your Manager, with the following lines:

```

=== Complete Event Details ===

Threat Details

Event: $introspector.getDisplayValue($event,"name")

Description:
$introspector.getDisplayValue($event,"message")

Severity:
$introspector.getDisplayValue($event,"severity")

-----
--

Source Details

Source Address:
$introspector.getDisplayValue($event,"attackerAddress")

Source Host Name:
$introspector.getDisplayValue($event,"attackerHostName")

Source Port:
$introspector.getDisplayValue($event,"sourcePort")

Source User Name:
$introspector.getDisplayValue($event,"sourceUserName")

-----
--

Target Details

```

```
Target Address:
$introspector.getDisplayValue($event,"targetAddress")

Target Host Name:
$introspector.getDisplayValue($event,"targetHostName")

Target Port: $introspector.getDisplayValue($event,"targetPort")

Target User Name:
$introspector.getDisplayValue($event,"targetUserName")

-----
--

Extra Information (where applicable)

Transport Protocol:
$introspector.getDisplayValue($event,"transportProtocol")

Base Event Count:
$introspector.getDisplayValue($event,"baseEventCount")

Template:
/home/arcsight/arcsight/Manager/config/notifications/Infosec.vm

-----
--
```

Once you have created the secondary templates, you can edit the `Email.vm` template to insert conditions that will call those templates.

As shown in the example below, insert a condition to call `Snort.vm` if the `deviceProduct` in the generated event matches "Snort".

```
#if( $introspector.getDisplayValue($event, "deviceProduct") ==
"Snort" )

#parse( "Snort.vm" )

#else

#parse( "Informative.vm" )

#end
```

## Customizing the template files

Follow these steps to customize the `Email.vm` and create any other secondary template files to receive customized e-mail notifications:

- 1 In `<ARCSIGHT_HOME>/config/notifications`, create a new secondary template file, as shown in the `Snort.vm` example in the previous section.
- 2 Save the file.
- 3 Edit `Email.vm` to insert the conditions, as shown in the example in the previous section.
- 4 Save `Email.vm`.

## Sample Output

If you use the `Snort.vm` template and modify `Email.vm` as explained in the previous section, here is the output these templates will generate:

```
Notification ID: fInjoQwBABCGMJkA-a8Z-Q== Escalation Level: 1

=== Complete Event Details ===

Threat Details

Event:                      Internal to External Port Scanning
Description:                Internal to External Port Scanning Activity
Detected; Investigate Business Need for Activity

Severity:                   2

-----
--

Source Details

Source Address:             10.129.26.37
Source Host Name:
Source Port:                0
Source User Name:          jdoe

-----
--

Target Details

Target Address:             161.58.201.13
Target Host Name:
Target Port:                20090
Target User Name:

-----
--

Extra Information (where applicable)

Transport Protocol:         TCP
Base Event Count:          1

Template:
/home/arcsight/arcsight/Manager/config/notifications/Snort.vm

-----
--

How to Respond

This message can be acknowledged in any of the following ways:
```

- 1) Reply to this email. Make sure that the notification ID listed in this message is present in your reply)
- 2) Login to the ArcSight Console and click on the notification button on the status bar
- 3) Login to myArcSight and go to the My Notifications Acknowledgment page at <https://mymanager.mycompany.com:9443/arcsight/app?service=page/NotifyHome>

To view the full alert please go to

## Appendix E

# The Archive Command Tool

---

This appendix is divided into the following sections:

[“Overview of the Archive Command Tool” on page 153](#)  
[“Exporting Resources to an Archive” on page 154](#)  
[“Importing Resources from an Archive” on page 155](#)  
[“Syntax for Performing Common Archive Tasks” on page 155](#)

**Note**

You can use the packages feature to archive resources from and import resource to your ArcSight Database. For more information about packages and how to use them, see the Managing Packages topic in ArcSight Console Online Help. For information about the packages command, see Appendix A of this guide.

You can use the `archive` command line tool to import and export resource information stored in the Database. You can use this tool in managing configuration information, for example, importing asset information collected from throughout your enterprise. You can also use this tool to archive resource information stored in the Database so that, for example, prior to installing new versions of ArcSight Express v3.0, you can simply restore all the resource information after completing the installation.

When archiving information from the Database, the `archive` command automatically creates the archive files you specify, saving resource objects in XML format. This documentation does not provide details on the structure of archive files and the XML schema used to store resource objects for re-import into ArcSight Express v3.0. If you have any special requirements for importing and exporting archive files, please contact your ArcSight representative.

## Overview of the Archive Command Tool

The ArcSight `archive` command tool can be run in two basic modes, remote or standalone. In remote mode, you can perform resource import or export operations from either an ArcSight Manager or ArcSight Console installation and can perform archive operations while ArcSight Manager is running. In standalone mode, from the computer where ArcSight Manager is installed, you can connect directly to the database to import or

export resource information, however, ArcSight Manager must be shut down before you perform archive operations.

**Caution**

Do not run the archive tool in standalone mode against a database currently in use by an ArcSight Manager as it is possible to corrupt the database.

The basic syntax for the `archive` command is the following:

Remote `archive` Command Syntax:

```
arcsight archive -u Username -m Manager [-p Password] -f Filename  
[-i | -sort] [-q] ...
```

**Caution**

The cacerts file on the Manager host must trust the Manager's certificate. You may have to update cacerts if you are using demo certificates by running:

```
arcsight tempca -ac
```

You do not need to run the above command if you run the `archive` command from the Console.

Standalone `archive` Command Syntax:

```
arcsight archive -standalone -f Filename [-i | -sort] [-q] ...
```

**Note**

Both remote and standalone `archive` commands support the same optional arguments.

See the description for the `archive` command in [Appendix A, , on page 87](#) for more information on this tool.

## Exporting Resources to an Archive

- 1 Open a shell window or a Windows command prompt window, on a computer where either ArcSight Console or ArcSight Manager is installed.

**Caution**

If you are on the computer where ArcSight Manager is installed, and are running the archive command in remote mode for the first time, go to the `<ARCSIGHT_HOME>/bin` directory and type the following:

```
arcsight tempca -ac
```

This command adds a certificate to the Manager's key store for secure SSL communication with the ArcSight Manager.

**Note**

From the `<ARCSIGHT_HOME>/bin` directory, you can enter the command, `arcsight archive -h` to get help. In that case, the command displays a list of parameters you can specify with the `archive` command.

From the `<ARCSIGHT_HOME>/bin` directory, enter the `arcsight archive` command along with any parameters you want to specify.

This command first logs into ArcSight Manager. It then displays a list of Resources available for archiving.

Note

If the ArcSight Manager is running, you must specify archive commands in remote mode, entering your user name, password, and Manager name to connect to ArcSight Manager. To run the archive command in standalone mode, accessing resources directly from the Database, enter `-standalone` rather than `-u <username> -p <password> -m <manager>`.

- 2 Enter the number of the resource type to archive.

The `archive` command now displays a list of options that let you choose which resource or group of resources within the resource type that you want to archive.

- 3 Choose the resource or group to archive.

After making your selection, you are prompted whether you want to add more resources to the archive.

- 4 You can continue adding additional resources to the archive list. When you've finished, answer no to the prompt

`Would you like to add more values to the archive? (Y/N)`

After it is finished writing the archive file, the archive command returns the command prompt, from which you can enter additional commands or exit.

## Importing Resources from an Archive

- 1 Open a shell window or a Windows command prompt window, on a computer where either ArcSight Console or ArcSight Manager is installed.

Caution

If you are on the computer where ArcSight Manager is installed, and are running the `archive` command in remote mode for the first time, go to the `<ARCSIGHT_HOME>/bin` directory and type the following:

```
arcsight tempca -ac
```

This command adds a certificate to the Manager's key store for secure SSL communication with the ArcSight Manager.

- 2 From the `<ARCSIGHT_HOME>/bin` directory, type `arcsight archive` with its parameters and attach `-i` for import.

Note

If the ArcSight Manager is running, you must specify archive commands in remote mode, entering your user name, password, and Manager name to connect to ArcSight Manager. To run the archive command in standalone mode, accessing resources directly from the ArcSight Database, enter `-standalone` rather than `-u <username> -p <password> -m <manager>`.

- 3 Select one of the listed options if there is a conflict.

Importing is complete when the screen displays `Import Complete`.

## Syntax for Performing Common Archive Tasks

For manual importing, run this command in `<ARCSIGHT_HOME>/bin`:

```
arcsight archive -i -format preferarchive -f <file name>  
-u <user> -m <manager hostname>
```

Before performing the import operation, you are prompted for a password to log in to the ArcSight Manager.

For exporting:

```
arcsight archive -f <file name>  
-u <user> -m <manager hostname>
```

Before performing the import operation, you are prompted for a password to log in to the ArcSight Manager and use a series of text menus to pick which Resources will be archived.

For scheduled/batch importing:

```
arcsight archive -i -q -format preferarchive  
-f <file name> -u <user>  
-p <password> -m <manager hostname>
```

For scheduled/batch exporting:

```
arcsight archive -u admin -p password -m arcsightserver  
-f somefile.xml -uri "/All Filters/Geographic Zones/West  
Coast"  
-uri "/All Filters/Geographic Zones/East Coast"
```

You can specify multiple URI resources with the URI parameter keyword by separating each resource with a space character, or you can repeat the URI keyword with each resource entry.

---

## Appendix F

# Monitoring System Health

---

This appendix provides some guidance about some of the configuration you can perform and some of the stock content you can use for monitoring system health. (This appendix does not attempt to list *all* stock content for monitoring system health.)

[“Overview” on page 157](#)

[“ArcSight Express v3.0 Component Configuration” on page 160](#)

[“ArcSight Express v3.0 Content Configuration” on page 161](#)

## Overview

ArcSight Express v3.0 performs self-auditing and self-monitoring, using ArcSight Express v3.0 and component event sources. When the appliances and SmartConnectors perform certain self-generated system operations (particularly system statistics and health monitoring), they each generate a corresponding event. ArcSight internal events can be leveraged to build content that provides a centralized/unified view of the health of an ArcSight deployment. This appendix details how to configure various components to send this information to a Manager, allowing comprehensive monitoring of the system health of your ArcSight deployment.

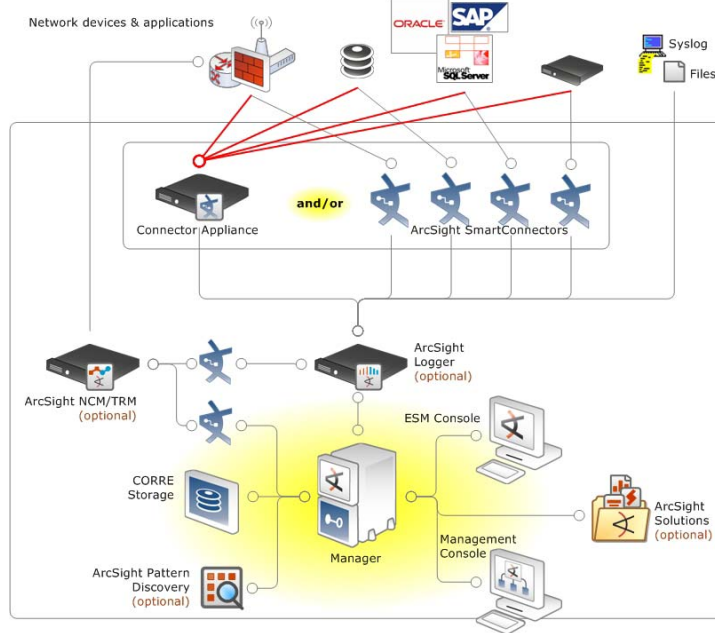

## What to Monitor

There are two types of internal events generated by all ArcSight components:

- Status Monitor Events – periodic statistics about system health such as EPS and database free space.
- Audit Events – Report actions in real time such as user authentication, activity, and resource modification.

For monitoring system health, it is the status monitor event that is of primary concern. You can configure appliances and connectors, to forward these events to the Manager. ArcSight Express v3.0 monitors its own local critical system events and the status monitor events sent from components. If any events match its alert criteria, indicating a critical situation, ArcSight Express v3.0 provides a summary of events for further investigation and a drill-down view.

The diagram below is an example of a common scenario that shows the flow of monitor events through an ArcSight appliance ecosystem.

A typical implementation targets the following network elements:

- Availability—Monitor critical devices, ArcSight connectors, and appliances
- Performance—CPU Usage, memory usage
- Network speed—Current EPS, EPS over time, inbound/outbound traffic
- Disk and Storage—Monitor disk usage and disk free space on appliances

In monitoring dependent components, ArcSight recommends a focus on the three most typical components: ArcSight SmartConnectors, and appliances.

## ArcSight Appliances

The internal monitoring events of an ArcSight appliance might monitor CPU usage, memory usage, current EPS, historical EPS, network interface statistics, and available disk usage. The following table shows a subset of appliance internal events that are most relevant for monitoring system health.

### Appliance Internal Events

|                   |                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------|
| CPU Statistics    | <ul style="list-style-type: none"> <li>Current value</li> </ul>                                                        |
| Disk Statistics   | <ul style="list-style-type: none"> <li>Disk space</li> <li>Read/Write</li> </ul>                                       |
| Event Statistics  | <ul style="list-style-type: none"> <li>EPS (receiver, forwarder)</li> <li>Event count (receiver, forwarder)</li> </ul> |
| Memory Statistics | <ul style="list-style-type: none"> <li>JVM memory</li> <li>Platform memory</li> </ul>                                  |

---

**Appliance Internal Events**

---

|                    |                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------|
| Network Statistics | <ul style="list-style-type: none"> <li>• Inbound usage</li> <li>• Outbound usage</li> </ul> |
|--------------------|---------------------------------------------------------------------------------------------|

---

You can find a description of system health events for ArcSight Logger in “Monitoring System Health” in the *ArcSight Logger Administrator's Guide*.

You can find a description of system health events for ArcSight Connector Appliance in “Audit Logs” in the *ArcSight Connector Appliance Administrator's Guide*.

## ArcSight Express v3.0

ArcSight Express v3.0 has a number of statistical monitors and alarms for every component of the ArcSight ecosystem. It can monitor SmartConnectors, database performance, resource exhaustion and has a number of reactive mechanisms such as notifications, SNMP forwarding, open cases and executing scripts to deal with system or hardware failures in real time. The following table shows a subset of internal events that are most relevant for monitoring system health. For a list of audit events, see “Audit Events” in the *ArcSight Express v3.0 User Guide*.

---

**ESM Internal Events**

---

|                                          |                                                                                                                                                 |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Resource Statistics                      | <ul style="list-style-type: none"> <li>• Open resource count</li> <li>• Queries/evaluations per second</li> </ul>                               |
| Resource Framework Statistics            | <ul style="list-style-type: none"> <li>• Inserts</li> <li>• Updates</li> <li>• Deletes</li> </ul>                                               |
| Rules Engine Statistics<br>(CPU, memory) | <ul style="list-style-type: none"> <li>• Events in rule engine</li> <li>• Events matching rules</li> <li>• Rate of correlated events</li> </ul> |
| Event border Statistics                  | <ul style="list-style-type: none"> <li>• Event count</li> <li>• Insert time</li> <li>• Retrieval time</li> </ul>                                |
| Main Flow Statistics                     | <ul style="list-style-type: none"> <li>• EPS (count since last monitor event)</li> <li>• Events (count since startup)</li> </ul>                |
| Side Table Statistics                    | <ul style="list-style-type: none"> <li>• Size</li> <li>• Insert</li> <li>• Cache (misses/hit rate)</li> </ul>                                   |
| Database Statistics                      | <ul style="list-style-type: none"> <li>• Free Space</li> <li>• Read/Write</li> </ul>                                                            |

---

# ArcSight Express v3.0 Component Configuration

## Configuring SmartConnectors

Connectors monitor the management connection and availability of the originating event sources.

If for some reason ArcSight Express v3.0 becomes unavailable, a SmartConnector will cache all the data locally, and when connectivity to ArcSight Express v3.0 resumes, send on the events. The following table shows a subset of internal events that are most relevant for monitoring system health.

| Connector and Device Events |                                                                                                                                                  |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Statistics           | <ul style="list-style-type: none"> <li>• Last event received</li> <li>• Total number of events</li> <li>• Event count Since last call</li> </ul> |
| Connector Flow Statistics   | <ul style="list-style-type: none"> <li>• Event rates</li> <li>• Cache size</li> </ul>                                                            |
| Connector Audit Events      | <ul style="list-style-type: none"> <li>• Start/stop</li> <li>• Heartbeat</li> <li>• Cache statistics</li> </ul>                                  |

The Connectors for your critical devices should be configured to send the "Connector Device Status" events to the ArcSight Manager periodically. To do this, configure the Connector to enable device status monitoring using the Connectors resource editor.

- 1 In the Navigator panel, go to Connectors and navigate to the Connector you want to configure.
- 2 Right-click the Connector and select **Configure**.
- 3 In the Connector editor in the Inspect/Edit panel, scroll down to the Processing section. In the Enable Device Status Monitoring (in milliseconds) field, enter how often you want the Connector to send Device Status Events.
  - ◆ For example, if the value is set to 300000, the Connector will send status events for all its devices every 5 minutes (300000 milliseconds).
  - ◆ If the value is set to -1, the Connector will send no Device Status events.

For more about enabling device status monitoring and configuring SmartConnectors, see the *ArcSight SmartConnector User's Guide*.

## Configuring the Connector Appliance

To configure the Connector Appliance to forward system health events, you need to add the Syslog Daemon connector to a container, set runtime parameters, and configure audit forwarding on the container. You can skip the steps below that are already done.

- 1 Upload an ArcSight Express v3.0 Certificate to Connector Appliance so that the appliance and Manager can communicate. Refer to the section "CA Certs Repository" in the *ArcSight Connector Appliance Administrator's Guide*.

For information about SSL Authentication and certificates, refer to the section "Understanding SSL Authentication" in the "Configuration" chapter of the *ArcSight Express v3.0 Administrator's Guide*.

- 2 Add the ArcSight Express v3.0 certificate to a Container. Refer to the section "Managing Certificates on a Container" in the *ArcSight Connector Appliance Administrator's Guide*.
- 3 Add the Syslog Daemon connector to the container to which you added the certificate. Refer to the section "Adding a Connector" in the *ArcSight Connector Appliance Administrator's Guide*.

When choosing a destination, select ArcSight Manager (encrypted).

- 4 Edit these runtime parameters for the Syslog Daemon connector:
  - ◆ Set the Preserve System Health Events parameter to Yes.
  - ◆ Set the Enable Device Status Monitoring (in milliseconds) field, to a positive number. The minimum interval is one minute, so use at least 60,000 ms. Smaller values result in one-minute intervals. Entries that are not a positive integer turn the feature off.

See "Editing Destination Runtime Parameters" in the *ArcSight Connector Appliance Administrator's Guide*.

- 5 Configure audit forwarding for the container that has the Syslog Daemon connector. Refer to the section "Audit Forwarding" in the *ArcSight Connector Appliance Administrator's Guide*.

## Configuring Logger

Logger is one of the many appliances from which system health events can be generated, then sent directly to a Manager. To initiate this communication, refer to the "Configuration" chapter in the *ArcSight Logger Administrator's Guide*. The section on "Event Input/Output" describes how to set up Logger to forward events to ArcSight Express v3.0.

**Note**

Audit events for alerts are only written to the Internal Storage group and not forwarded to ArcSight Express v3.0 by default. If you need to forward these audit events to ArcSight Express v3.0, please contact ArcSight Customer Support for assistance. Please note that this change only applies to audit events generated for alerts; other audit events are unaffected.

## Configuring ArcSight Express v3.0

You can use a Forwarding Connector to also communicate health related events from a source Manager to a destination Manager, if you have such a hierarchical arrangement. For information, refer to the "Configuration" chapter of the *ArcSight SmartConnector Configuration Guide* for Forwarding Connectors.

## ArcSight Express v3.0 Content Configuration

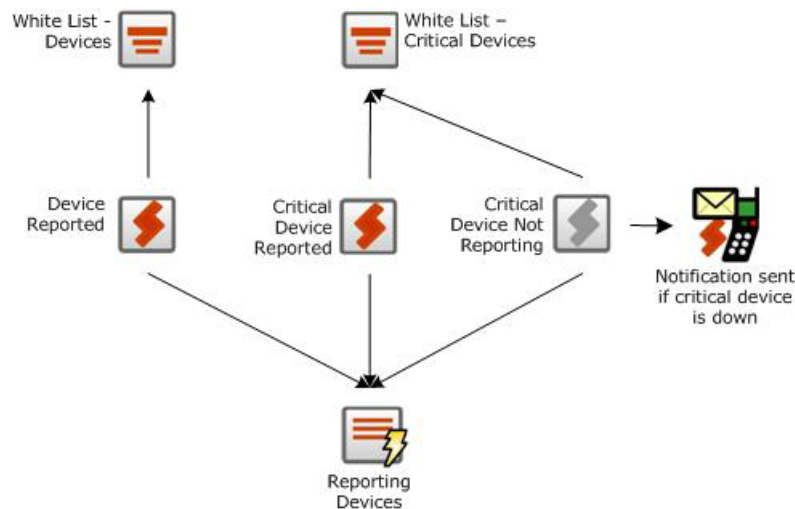

### Configure Critical Device Not Reporting Resources

The ArcSight Administration content includes resources that monitor the devices in your network and send a notification when one of your critical devices is down. This content

functions off the Device Status events sent by SmartConnectors that you configured in ["Configuring SmartConnectors" on page 160](#).

| Resource Type | Universal Resource Identifier (URI)                                              | Resource Name                    |
|---------------|----------------------------------------------------------------------------------|----------------------------------|
| Filter        | /All Filters/ArcSight<br>Administration/Connectors/System<br>Health/Custom/      | White List -<br>Devices          |
| Filter        | /All Filters/ArcSight<br>Administration/Connectors/System<br>Health/Custom/      | White List - Critical<br>Devices |
| Rule          | /All Rules/ArcSight<br>Administration/Connectors/System<br>Health/               | Device Reported                  |
| Rule          | /All Rules/ArcSight<br>Administration/Connectors/System<br>Health/Custom/        | Critical Device<br>Reported      |
| Rule          | /All Rules/ArcSight<br>Administration/Connectors/System<br>Health/Custom/        | Critical Device Not<br>Reporting |
| Active List   | /All Active Lists/ArcSight<br>Administration/Connectors/System<br>Health/Custom/ | Reporting Devices                |

The *Device Reporting* rules reference the White List filters for which devices to track and insert in the *Reporting Devices* active list.

## Configure White List Filters

The *White List - Devices* filter tells the *Devices Reported* rule which devices to track that send Device Status events to the Manager. By default, the condition in the filter is *True*, which means that all the devices that send Device Status events will be inserted in the *Reporting Devices* active list.

Modify this filter to choose only the devices you want to insert in the *Reporting Devices* active list. Entries in this active list never expire.

The *White List - Critical Devices* filter tells the *Critical Device Reported* rule which devices to track that send Device Status events and are also categorized as criticality High ([All Asset Categories/System Asset Categories/Criticality/High](#)).

Modify this filter to choose the critical devices you want to monitor closely and about which you want to be notified when they are not reporting.

The devices in *Reporting Devices* active list are likely to be a subset of the devices in the *Reporting Device* active list. By default, the filter will pick all the assets that are categorized as [All Asset Categories/System Asset Categories/Criticality/High](#). Create conditions that match your critical devices, and categorize your critical assets (or zones) as [All Asset Categories/System Asset Categories/Criticality/High](#).

#### To modify the filters to select only the devices you specify:

- 1 In the Navigator panel, navigate to the [White List filters \(/All Filters/ArcSight Administration/Connectors/System Health/Custom/\)](#) and double-click the one you want to modify to open it in the Inspect/Edit panel.
- 2 In the Filter editor in the Inspect/Edit panel, select the Filter tab.
  - ◆ **White List - Devices filter:** Delete the default condition [True](#) (select the condition and press **Delete**).
  - ◆ **White List - Critical Devices filter:** Leave the Attacker Asset ID and Attacker Zone conditions in place. These identify the asset as being categorized as criticality high.
- 3 Construct an expression that captures the devices you want the rule to evaluate.
  - ◆ **White List - Devices filter:** Select [event1](#) and add an AND operator (click the AND icon ). Use the event fields grid to build the condition, or right-click [event1](#) and select **New Condition**.
  - ◆ **White List - Critical Devices filter:** Select [event1](#) and use the event fields grid to build the condition, or right-click [event1](#) and select **New Condition**.

Depending on the devices you want to capture, you can use device vendor/product, asset categories, and other conditions.

- **Use Device Custom strings.** You can use Device Custom strings to express device vendor and device product fields. [Device Custom String1](#) is the device vendor, [Device Custom String2](#) is the device product. For example:

```
Device Custom String1 = Device Vendor ABC
```

```
Device Custom String2 = Device Product XYZ (this will select all the devices with that device vendor/product)
```

- **Use Attacker fields.** The attacker fields correspond to the device. Use these fields to specify an IP address, a zone or an asset category using the "Attacker" fields and the appropriate operator. For example:

```
Attacker Zone = /All Zones/... (This checks if the device is in a zone)
```

- **Use Assets conditions.** Use the Assets condition button to check if a device is in one or more asset categories. For example:

```
Attacker Asset ID inGroup /All Asset Categories/...
```

- 4 Click **OK** to apply changes and close the Filter editor.

For more about working with the Common Conditions Editor, see the online Help topic *Common Conditions Editor*.

## Configure Critical Device Not Reporting Rule

The *Critical Device Not Reporting* rule is disabled by default. Enable the rule if you want to be notified when one of your critical devices is down. Enable the rule only after you modified the *White List - Critical Devices* filter.

### To enable the rule:

- 1 In the Navigator panel, go to **Rules > All Rules > ArcSight Administration > Connectors > System Health > Custom**.
- 2 Right-click the rule *Critical Device Not Reporting* and select **Enable Rule**.

### To enable the Create New Case action if a critical device goes down:

To also create a case when the rule conditions are met, edit the *Create New Case* action to give it an owner and enable the action.

- 1 Select the *Create New Case* action and click **Edit** in the toolbar at the top of the Actions tab.
- 2 In the *Edit Action* dialog box in the Owner drop-down menu, navigate to and select an appropriate user. Click **OK**.
- 3 Select, then right-click the *Create New Case* action and select **Enable**. Click **OK**.

## Configure Connector Up/Down Resources

The ArcSight Express v3.0 content provides the following resources that monitor the operational status of SmartConnectors configured on the ArcSight Manager.

| Resource Type | Universal Resource Identifier (URI)                                        | Resource Name           |
|---------------|----------------------------------------------------------------------------|-------------------------|
| Filter        | /All Filters/ArcSight Administration/Connectors/System Health/Custom/      | Black List - Connectors |
| Rule          | /All Rules/ArcSight Administration/Connectors/System Health/               | Connector Down          |
| Rule          | /All Rules/ArcSight Administration/Connectors/System Health/               | Connector Up            |
| Active List   | /All Active Lists/ArcSight Administration/Connectors/System Health/Custom/ | Black List - Connectors |

The rules *Connector Up* and *Connector Down* detect SmartConnectors that are started and reporting events and those that are shut down, and send a notification when Connectors have been down for a certain period of time (by default, 20 minutes).

There may be situations in which you want to exclude certain Connectors from being evaluated by these rules, for example if:

- You have Connectors that you start and stop manually. For example, if you start a TestAlert connector to replay some events, then stop it when you are done, and you

don't want to get a notification saying that the connector is down every 20 minutes until you restart it.

- After installing and configuring ArcSight, you get unwanted notifications about Connectors going down. You can opt to not receive Connector down notifications from those Connectors.
- You have a Connector scheduled to run once every week (such as a vulnerability scanner), and the Connector is otherwise down in the time in between.
- You are testing a new Connector and you will be starting and stopping it frequently during the set-up process.

For these situations, the *Connector Up* and *Connector Down* rules also reference a filter, which points to the *Black List - Connectors* active list, as shown below.

To exclude certain SmartConnectors from being evaluated by these rules, enter the SmartConnector's URI and IP address in the *Black List - Connectors* active list.

- 1 In the Navigator panel, go to **Lists > Active Lists > All Active Lists > ArcSight Administration > Connectors > System Health > Custom**.
- 2 Right-click the active list *Black List - Connectors* and select **Edit Active List**.
- 3 In the Active List Editor in the Inspect/Edit panel, click **Add Entry**.
- 4 In the ActiveList Entry Editor, enter the URI of the SmartConnector (starting with [All Connectors](#)) and the Connector's IP address and click **Add**. For example:

The screenshot shows the **ActiveList Entry Editor** window. The title bar reads "ActiveList Entry Editor". Below the title bar, the text "ActiveList Entry Editor" is repeated. The "Active List:" dropdown is set to "Black List - Connectors". A table with two columns, "Name" and "Value", contains the following entries:

| Name               | Value                                           |
|--------------------|-------------------------------------------------|
| Connector URI      | All Connectors/Site Connectors/Cisco VPN Syslog |
| Connector Address  | 111.22.33.0                                     |
| Creation Time      |                                                 |
| Last Modified Time |                                                 |
| Count              | 1                                               |

At the bottom of the window, there are five buttons: **Modify**, **Add**, **Delete**, **Reset**, and **Cancel**.

- 5 Repeat steps 3 and 4 for every SmartConnector you want to exclude from the Connector Up/Down rules.

For more about working with active lists, see the topic *Managing Active Lists* in the *ArcSight Express v3.0 User's Guide*.

**To populate Active Lists from an imported CSV file:**

- 1** In the Navigator panel, navigate to the active list you want to configure ([Lists > Active Lists](#)).
- 2** Generate a CSV file with the values with which you wish to populate the active list, and save it to a directory on the Console system.
- 3** Right-click the active list you wish to import the values into and select **Import CSV File...**
- 4** In the Open dialog box, navigate to and select the CSV file and click **Open**.
