# 1. Release Notes

This document provides the new features, installation and upgrade notes, known issues, and workarounds that apply to release 25.4 of OpenText™ Core SAST Aviator.

This information is not available elsewhere in the product documentation. The user guides for this product are available on the Product Documentation website:

<https://www.microfocus.com/documentation/fortify-static-code/>

# 1.1. Fortify product name changes

OpenText is in the process of changing the following product names:

| Previous name                    | New name                                                         |
|----------------------------------|------------------------------------------------------------------|
| Fortify Static Code Analyzer     | OpenText™ Static Application Security Testing (OpenText SAST)    |
| Fortify Software Security Center | OpenText™ Application Security                                   |
| Fortify WebInspect               | OpenText™ Dynamic Application Security Testing (OpenText DAST)   |
| Fortify on Demand                | OpenText™ Core Application Security                              |
| Debricked                        | OpenText™ Core Software Composition Analysis (OpenText Core SCA) |
| Fortify Applications and Tools   | OpenText™ Application Security Tools                             |

The product names have changed on product splash pages, mastheads, login pages, and other places where the product is identified. The name changes are intended to clarify product functionality and to better align the Fortify Software products with OpenText. In some cases, such as on the documentation title page, the old name might temporarily be included in parenthesis. You can expect to see more changes in future product releases.

## 1.2. New features

### Features/updates

- Version 25.4 introduces auto-remediation. See the OpenText™ Core SAST Aviator User Guide for details. As of 25.4, this works from the fcli command line, and for the off-cloud and hosted cases (Fortify Software Security Center). Support for IDEs, and support for OpenText™ Core Application Security (FoD) is planned.
- Version 25.4 (non-FoD) has a new mechanism for limiting the number of issues get processed for very large FPRs. This new limiting mechanism is based on the concept of quota. See the OpenText™ Core SAST Aviator User Guide for details. Applications that were already created before 25.4 will receive full initial quota; prior use will not be taken into account.
- New command to add SAST Aviator tags to the Fortify Software Security Center filter templates thus ensuring all the relevant templates are aligned with SAST Aviator tagging requirements. This helps to accurately classify the issues and report them.
- New commands to select a filter set and folder or folders for auditing issues.
- New command to audit all issues by ignoring the filter sets including the default enabled one.

### Installation and upgrade notes

- fcli v3.11.x or later

**Note**

An earlier version of the Release Notes referenced fcli v3.10.x version. This version was later identified to contain a bug and should not be used with SAST Aviator.
